

AS7C1026 AS7C31026

#### **Features**

- AS7C1026 (5V version)
- AS7C31026 (3.3V version)
- Industrial and commercial versions
- Organization: 65,536 words x 16 bits
- Center power and ground pins for low noise
- High speed
  - 10/12/15/20 ns address access time
  - 5/6/8/10 ns output enable access time
- Low power consumption: ACTIVE
  - 880 mW (AS7C1026) / max @ 12 ns
  - 396 mW (AS7C31026) / max @ 12 ns

- Low power consumption: STANDBY
  28 mW (AS7C1026) / max CMOS I/O
  - 18 mW (AS7C31026) / max CMOS I/O
- 2.0V data retention
- Easy memory expansion with CE, OE inputs
- TTL-compatible, three-state I/O
- JEDEC standard packaging
  - 44-pin 400 mil SOJ
  - 44-pin 400 mil TSOP II
  - 48-ball 6 mm  $\times$  8 mm CSP mBGA
- ESD protection  $\geq$  2000 volts
- Latch-up current  $\geq 200 \text{ mA}$

#### **Functional description**

The AS7C1026 and AS7C31026 are high-performance CMOS 1,048,576-bit Static Random Access Memory (SRAM) devices organized as 65,536 words x 16 bits. They are designed for memory applications where fast data access, low power, and simple interfacing are desired.

Equal address access and cycle times ( $t_{AA}$ ,  $t_{RC}$ ,  $t_{WC}$ ) of 10/12/15/20 ns with output enable access times ( $t_{OE}$ ) of 5/6/8/10 ns are ideal for high-performance applications.

When CE is high the devices enter stanby mode. The AS7C1026 is guaranteed not to exceed 28 mW power consumption in CMOS standby mode. The devices also offer 2.0V data retention.

A write cycle is accomplished by asserting write enable (WE) and chip enable (CE). Data on the input pins I/O0–I/O15 is written on the rising edge of WE (write cycle 1) or CE (write cycle 2). To avoid bus contention, external devices should drive I/O pins only after outputs have been disabled with output enable (OE) or write enable (WE).

A read cycle is accomplished by asserting output enable (OE) and chip enable (CE), with write enable (WE) high. the chips drive I/O pins with the data word referenced by the input address. When either chip enable or output enable is inactive, or write enable is active, output drivers stay in high-impedance mode.

The devices provide multiple center power and ground pins, and separate byte enable controls, allowing individual bytes to be written and read. LB controls the lower bits, I/O0–I/O7, and UB controls the higher bits, I/O8–I/O15.

All chip inputs and outputs are TTL-compatible, and operation is from a single 5V supply (AS7C1026) or 3.3V supply (AS7C31026). the device is packaged in common industry standard packages. Chip scale BGA packaging, easy to use in manufacturing, provides the smallest possible footprint. This 48-ball JEDEC-registered package has a ball pitch of 0.75 mm and external dimensions of 8 mm  $\times$  6 mm.

Parameter		Symbol	Min	Max	Unit
Valtage on V relative to CND	AS7C1026	V <sub>t1</sub>	-0.50	+7.0	V
Voltage on $V_{CC}$ relative to GND	AS7C31026	V <sub>t1</sub>	-0.50	+5.0	V
Voltage on any pin relative to GND		V <sub>t2</sub>	-0.50	V <sub>CC</sub> +0.50	V

#### Absolute maximum ratings

Note: Stresses greater than those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions outside those indicated in the operational sections of this spec ification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

#### Truth table

#### AC test conditions

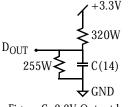

- Output load: see Figure B or Figure C, except as noted.
- Input pulse level: GND to 3.0V. See Figure A.
- Input rise and fall times: 2 ns. See Figure A.
- Input and output timing reference levels: 1.5V.

Thevenin Equivalent:

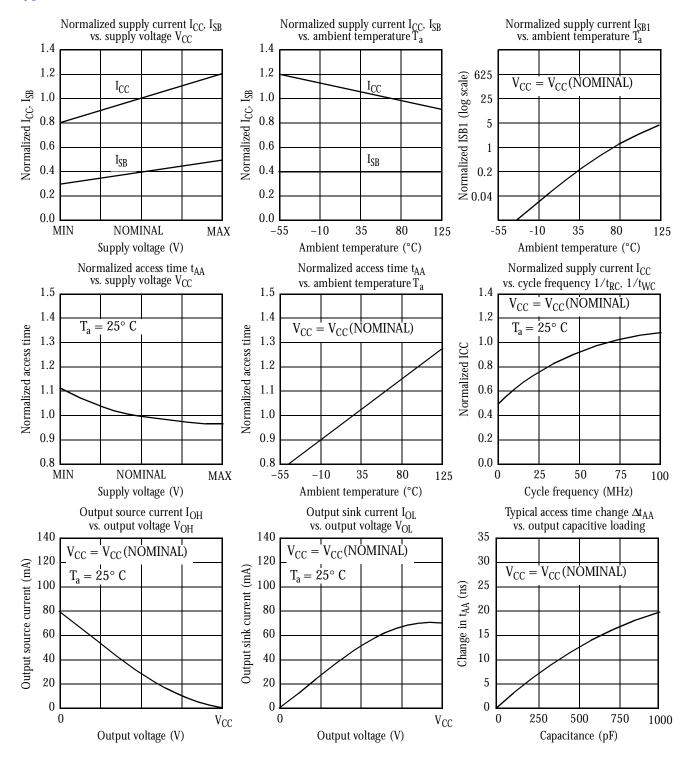

Figure C: 3.3V Output load

#### **Notes**

- During  $V_{CC}$  power-up, a pull-up resistor to  $V_{CC}$  on  $\overline{CE}$  is required to meet  $I_{SB}$  specification. 1
- This parameter is sampled, but not 100% tested. 2
- For test conditions, see AC Test Conditions, Figures A, B, and C. 3
- These parameters are specified with  $C_L = 5pF$ , as in Figures B or C. Transition is measured  $\pm 500$  mV from steady-state voltage. 4
- 5 This parameter is guaranteed, but not tested.
- 6 WE is High for read cycle.
- 7 CE and OE are Low for read cycle.
- Address valid prior to or coincident with CE transition Low. 8
- 9 All read cycle timings are referenced from the last valid address to the first transitioning address.
- 10 CE or WE must be High during address transitions. Either CE or WE asserting high terminates a write cycle.
- 11 All write cycle timings are referenced from the last valid address to the first transitioning address.
- 12 Not applicable.
- 13 2V data retention applies to commercial temperature range operation only.
- 14 C=30pF, except all high Z and low Z parameters where C=5pF.
