## Features

- AS7C1026 (5V version)
- AS7C3 1026 (3.3V version)
- Industrial and commercial versions
- Organization: 65,536 words x 16 bits
- Center power and ground pins for low noise
- High speed
- 12/15/20 ns address access time
- $6,7,8$ ns output enable access time
- Low power consumption: ACTIVE
- 880 mW (AS7C1026) / max @ 12 ns
- 396 mW (AS7C31026) / max @ 12 ns

## Logic block diagram

- Low power consumption: STANDBY
- 28 mW (AS7C1026) / max CMOS I/O
- 18 mW (AS7C31026) / max CMOS I/O
- Easy memory expansion with $\overline{\mathrm{CE}}, \overline{\mathrm{OE}}$ inputs
- TTL-compatible, three-state I/O
- JEDEC standard packaging
- 44-pin 400 mil SOJ
- 44-pin TSOP 2
- 48-ball $6 \times 8 \mathrm{~mm}$ BGA
- ESD protection $\geq 2000$ volts
- Latch-up current $\geq 200 \mathrm{~mA}$

## Pin and ball arrangement

## Selection guide

|  |  | $\mathbf{- 1 2}$ | $\mathbf{- 1 5}$ | $\mathbf{- 2 0}$ | Unit |

|  | AS7C31026 | 110 | 100 | 90 | mA |
| Maximum CMOS standby current | AS7C1026 | 10 | 10 | 15 | mA |
|  | AS7C31026 | 10 | 10 | 15 | mA |

## Functional description

The AS7C1026 and AS7C31026 are high-performance CMOS 1,048,576-bit Static Random Access Memory (SRAM) devices organized as 65,536 words x 16 bits. They are designed for memory applications where fast data access, low power, and simple interfacing are desired.

Equal address access and cycle times $\left(\mathrm{t}_{\mathrm{AA}}, \mathrm{t}_{\mathrm{RC}}, \mathrm{t}_{\mathrm{WC}}\right)$ of $12 / 15 / 20 \mathrm{~ns}$ with output enable access times $\left(\mathrm{t}_{\mathrm{OE}}\right)$ of $6,7,8 \mathrm{~ns}$ are ideal for high-performance applications.
When $\overline{\mathrm{CE}}$ is high the devices enter stanby mode. The AS7C1026 is guaranteed not to exceed 28 mW power consumption in CMOS standby mode.
A write cycle is accomplished by asserting write enable ( $\overline{\mathrm{WE}}$ ) and chip enable ( $\overline{\mathrm{CE}}$ ). Data on the input pins I/O0-I/O15 is written on the rising edge of $\overline{\mathrm{WE}}$ (write cycle 1) or $\overline{\mathrm{CE}}$ (write cycle 2). To avoid bus contention, external devices should drive I/O pins only after outputs have been disabled with output enable ( $\overline{\mathrm{OE}})$ or write enable ( $\overline{\mathrm{WE}}$ ).
A read cycle is accomplished by asserting output enable ( $\overline{\mathrm{OE}})$ and chip enable ( $\overline{\mathrm{CE}})$, with write enable ( $\overline{\mathrm{WE}}$ ) high. the chips drive I/ O pins with the data word referenced by the input address. When either chip enable or output enable is inactive, or write enable is active, output drivers stay in high-impedance mode.
The devices provide multiple center power and ground pins, and separate byte enable controls, allowing individual bytes to be written and read. $\overline{\mathrm{LB}}$ controls the lower bits, I/O0-I/O7, and $\overline{\mathrm{UB}}$ controls the higher bits, I/O8-I/O15.

All chip inputs and outputs are TTL-compatible, and operation is from a single 5 V supply (AS7C1026) or 3.3V supply (AS7C31026). the device is packaged in common industry standard packages. BGA packaging, easy to use in manufacturing, provides the smallest possible footprint. This 48-ball JEDEC-registered package has a ball pitch of 0.75 mm and external dimensions of $8 \mathrm{~mm} \times 6 \mathrm{~mm}$.

Absolute maximum ratings

| Parameter |  | Symbol | Min | Max | Unit |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Voltage on $\mathrm{V}_{\text {CC }}$ relative to GND | AS7C1026 | $\mathrm{V}_{\mathrm{t} 1}$ | $-0.50$ | +7.0 | V |
|  | AS7C31026 | $\mathrm{V}_{\mathrm{t} 1}$ | -0.50 | +5.0 | V |
| Voltage on any pin relative to GND |  | $\mathrm{V}_{\mathrm{t} 2}$ | -0.50 | $\mathrm{V}_{\mathrm{CC}}+0.50$ | V |
| Power dissipation |  | $\mathrm{P}_{\mathrm{D}}$ | - | 1.0 | W |
| Storage temperature (plastic) |  | $\mathrm{T}_{\text {stg }}$ | -65 | +150 | ${ }^{\circ} \mathrm{C}$ |
| Ambient temperature with VCC applied |  | $\mathrm{T}_{\text {bias }}$ | -55 | +125 | ${ }^{\circ} \mathrm{C}$ |
| DC current into outputs (low) |  | $\mathrm{I}_{\text {OUT }}$ | - | 20 | mA |

Note: Stresses greater than those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions outside those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

## Truth table

## AC test conditions

- Output load: see Figure B or Figure C, except as noted.
- Input pulse level: GND to 3.0V. See Figure A.
- Input rise and fall times: 2 ns . See Figure A.
- Input and output timing reference levels: 1.5 V .

Figure A: Input pulse

Figure B: 5V Output load

Thevenin Equivalent:
$\mathrm{D}_{\text {OUT }} \overbrace{}^{168 \mathrm{~W}}+1.728 \mathrm{~V}$ ( 5 V and 3.3 V )

Figure C: 3.3V Output load

## Notes

1 During $\mathrm{V}_{\mathrm{CC}}$ power-up, a pull-up resistor to $\mathrm{V}_{\mathrm{CC}}$ on $\overline{\mathrm{CE}}$ is required to meet $\mathrm{I}_{\mathrm{SB}}$ specification.
2 This parameter is sampled, but not $100 \%$ tested.
3 For test conditions, see AC Test Conditions, Figures A, B, and C.
4 These parameters are specified with $\mathrm{C}_{\mathrm{L}}=5 \mathrm{pF}$, as in Figures B or C. Transition is measured $\pm 500 \mathrm{mV}$ from steady-state voltage.
5 This parameter is guaranteed, but not tested.
$6 \quad \overline{\mathrm{WE}}$ is High for read cycle.
$7 \quad \overline{\mathrm{CE}}$ and $\overline{\mathrm{OE}}$ are Low for read cycle.
8 Address valid prior to or coincident with $\overline{\mathrm{CE}}$ transition Low.
9 All read cycle timings are referenced from the last valid address to the first transitioning address.
$10 \overline{\mathrm{CE}}$ or $\overline{\mathrm{WE}}$ must be High during address transitions. Either $\overline{\mathrm{CE}}$ or $\overline{\mathrm{WE}}$ asserting high terminates a write cycle.
11 All write cycle timings are referenced from the last valid address to the first transitioning address.
2 Not applicable.
$3 \mathrm{C}=30 \mathrm{pF}$, except all high Z and low Z parameters where $\mathrm{C}=5 \mathrm{pF}$.
