

# S71JL128HC0/128HB0/064HB0/ 064HA0/064H80

Stacked Multi-Chip Product (MCP) Flash Memory  
and pSRAM CMOS 3.0 Volt-only,  
Simultaneous Operation Flash Memories and  
Static RAM/Pseudo-static RAM

PRELIMINARY

## DISTINCTIVE CHARACTERISTICS

### MCP Features

- **Operating Voltage Range of 2.7 to 3.3 V**
- **High Performance**
  - Access time as fast as 55 ns
- **Packages**
  - 73-ball FBGA—8 x 11.6 mm
  - 88-ball FBGA—8 x 11.6 mm
- **Operating Temperatures**
  - Wireless: -25°C to +85°C
  - Industrial: -40°C to +85°C

## GENERAL DESCRIPTION

The S71JLxxxH Series is a product line of stacked Multi-Chip Products (MCP) and consists of

- **One or more S29JL064H Flash devices**
- **SRAM or pSRAM options**
  - 8Mb x 8/x 16 SRAM
  - 16Mb x 16-only SRAM
  - pSRAM x 16 only:
    - 8Mb pSRAM
    - 16Mb pSRAM
    - 32Mb pSRAM
    - 64Mb pSRAM

The products covered by this document are listed below. For details about their specifications, please refer to the individual constituent data sheets for further details.

MCP	Number of S29JL064H	Total Flash Density	SRAM/pSRAM Density
S71JL064H80	1	64Mb	8Mb
S71JL064HA0	1	64Mb	16Mb
S71JL064HB0	1	64Mb	32Mb
S71JL128HB0	2	128Mb	32Mb
S71JL128HC0	2	128Mb	64Mb

### Notes:

1. This MCP is only guaranteed to operate @ 2.7 - 3.3 V regardless of component operating ranges.
2. BYTE# operation is only supported on the S71JL064H80xx0x.

## Product Selector Guide

Device-Model #	SRAM/pSRAM Density	SRAM/pSRAM Type	Supplier	Flash Access Time (ns)	RAM Access Time (ns)	Packages
S71JL064H80Bxx01	8Mb	SRAM - x8/x16	Supplier 1	70	70	FLB073
S71JL064H80Bxx02	8Mb	SRAM - x8/x16	Supplier 1	85	85	FLB073

### Special Package Handling Instructions for FBGA Package

Special handling is required for Flash Memory products in FBGA packages.

Flash memory devices in FBGA packages may be damaged if exposed to ultrasonic cleaning methods. The package and/or data integrity may be compromised if the package body is exposed to temperatures above 150°C for prolonged periods of time.

#### Pin Description

### Special Package Handling Instructions

Special handling is required for Flash Memory products in molded packages (TSOP, BGA, PDIP, SSOP, PLCC). The package and/or data integrity may be compromised if the package body is exposed to temperatures above 150°C for prolonged periods of time.

## Look-ahead Connection Diagram

### 96-ball Fine-Pitch Ball Grid Array (Top View, Balls Facing Down)

**Legend:**

ds = Data storage only  
 f = Flash shared only  
 f1 = 1st Flash only  
 f2 = 2nd Flash only  
 NC = Outrigger balls  
 s = RAM shared  
 s1 = 1st RAM only  
 s2 = 2nd RAM only

**Note:** To provide customers with a migration path to higher densities and an option to stack more die in a package, FASL has prepared a standard pinout that supports

- NOR Flash and SRAM densities up to 4 Gigabits
- NOR Flash and pSRAM densities up to 4 Gigabits

■ *NOR Flash and pSRAM and DATA STORAGE densities up to 4 Gigabits*

*The signal locations of the resultant MCP device are shown above. Note that for different densities, the actual package outline may vary. Any pinout in any MCP, however, will be a subset of the pinout above.*

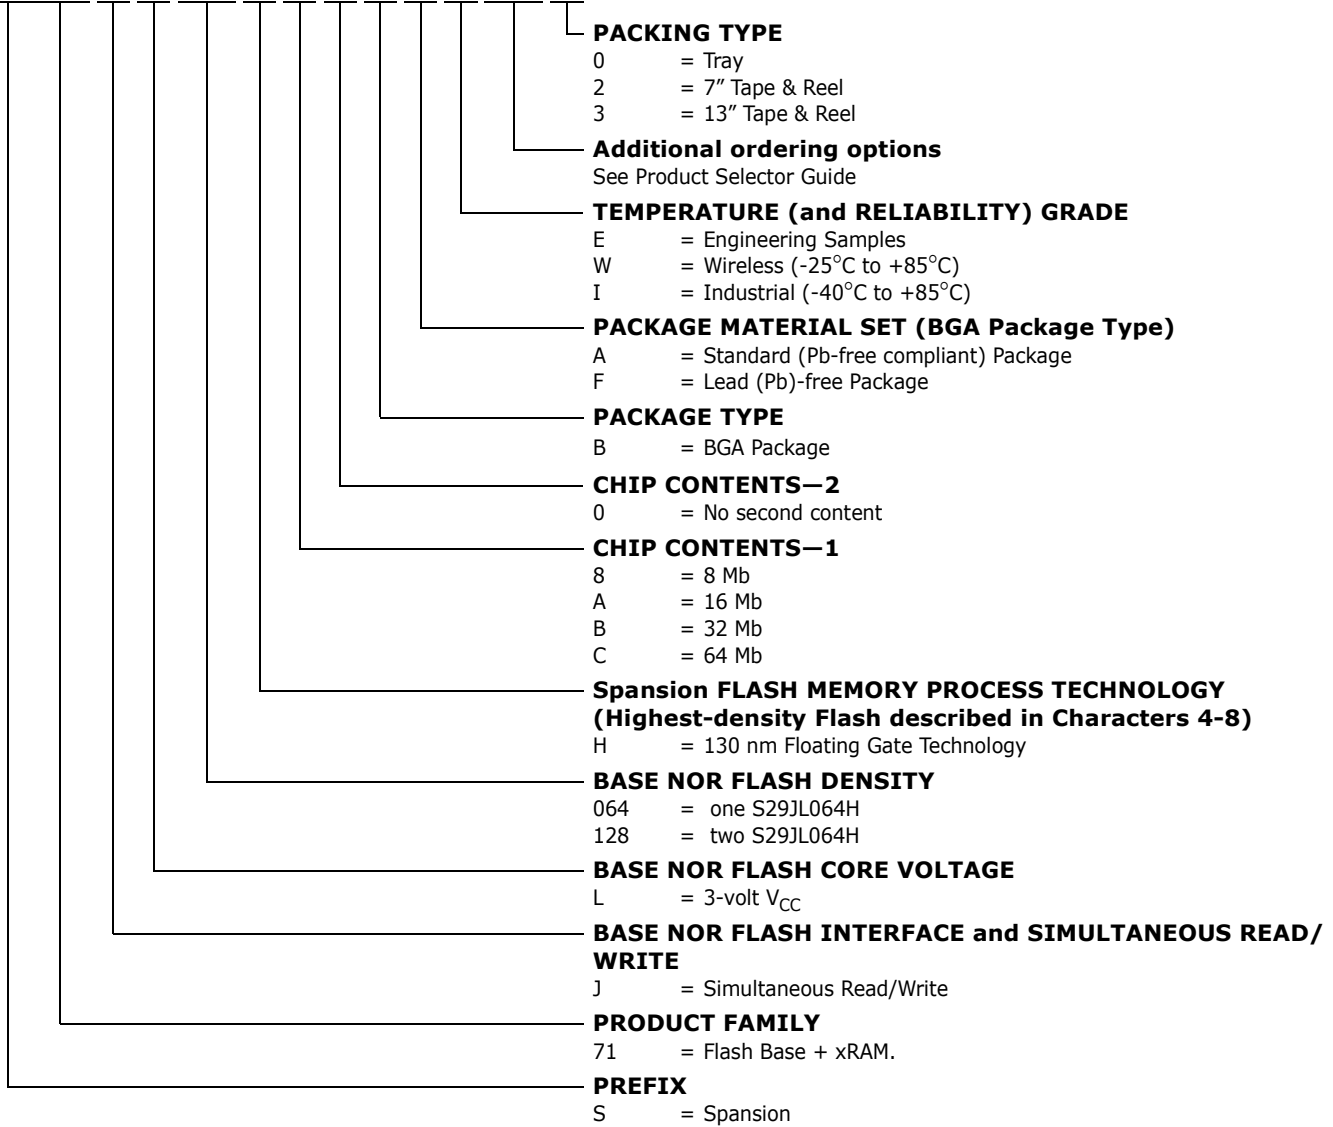

*In some cases, there may be outrigger balls in locations outside the grid shown above. In such cases, the user is recommended to treat them as reserved and not connect them to any other signal.*

*For any further inquiries about the above look-ahead pinout, please refer to the application note on this subject or contact your sales office.*

## Ordering Information

The order number (Valid Combination) is formed by the following:

**S 71 J L 064 H A 0 B A W 00 0**

### Valid Combinations

Valid Combinations list configurations planned to be supported in volume for this device. Consult the local sales office to confirm availability of specific valid combinations and to check on newly released combinations.

NOTES:

- DIMENSIONING AND TOLERANCING METHODS PER ASME Y14.5M-1994.
- ALL DIMENSIONS ARE IN MILLIMETERS.
- BALL POSITION DESIGNATION PER JESD 95-1, SPP-010.
- [e] REPRESENTS THE SOLDER BALL GRID PITCH.
- SYMBOL "MD" IS THE BALL MATRIX SIZE IN THE "D" DIRECTION.  
SYMBOL "ME" IS THE BALL MATRIX SIZE IN THE "E" DIRECTION.  
n IS THE NUMBER OF POPULATED SOLDER BALL POSITIONS FOR MATRIX SIZE MD X ME.
- [6] DIMENSION "b" IS MEASURED AT THE MAXIMUM BALL DIAMETER IN A PLANE PARALLEL TO DATUM C.
- [7] SD AND SE ARE MEASURED WITH RESPECT TO DATUMS A AND B AND DEFINE THE POSITION OF THE CENTER SOLDER BALL IN THE OUTER ROW.  
WHEN THERE IS AN ODD NUMBER OF SOLDER BALLS IN THE OUTER ROW SD OR SE = 0.000.  
WHEN THERE IS AN EVEN NUMBER OF SOLDER BALLS IN THE OUTER ROW, SD OR SE = [e/2]
- "+" INDICATES THE THEORETICAL CENTER OF DEPOPULATED BALLS.
- N/A
- [10] A1 CORNER TO BE IDENTIFIED BY CHAMFER, LASER OR INK MARK, METALLIZED MARK INDENTATION OR OTHER MEANS.

**For Multi-Chip Products (MCP)  
64 Megabit (8 M x 8-Bit/4 M x 16-Bit)  
CMOS 3.0 Volt-only, Simultaneous Read/Write  
Flash Memory**

## Distinctive Characteristics

### Architectural Advantages

- **Simultaneous Read/Write operations**
  - Data can be continuously read from one bank while executing erase/program functions in another bank.
  - Zero latency between read and write operations
- **Flexible Bank architecture**
  - Read may occur in any of the three banks not being written or erased.
  - Four banks may be grouped by customer to achieve desired bank divisions.
- **Boot Sectors**
  - Top and bottom boot sectors in the same device
  - Any combination of sectors can be erased
- **Manufactured on 130 nm process technology**
- **SecSi™ (Secured Silicon) Sector: Extra 256 Byte sector**
  - *Factory locked and identifiable*: 16 bytes available for secure, random factory Electronic Serial Number; verifiable as factory locked through autoselect function.
  - *Customer lockable*: One-time programmable only. Once locked, data cannot be changed
- **Zero Power Operation**
  - Sophisticated power management circuits reduce power consumed during inactive periods to nearly zero.
- **Compatible with JEDEC standards**
  - Pinout and software compatible with single-power-supply flash standard

### Performance Characteristics

- **High performance**
  - Access time as fast as 55 ns
  - Program time: 4  $\mu$ s/word typical using accelerated programming function
- **Ultra low power consumption (typical values)**
  - 2 mA active read current at 1 MHz

- 10 mA active read current at 5 MHz
- 200 nA in standby or automatic sleep mode

- **Cycling Endurance: 1 million cycles per sector typical**

- **Data Retention: 20 years typical**

### Software Features

- **Supports Common Flash Memory Interface (CFI)**
- **Erase Suspend/Erase Resume**
  - Suspends erase operations to read data from, or program data to, a sector that is not being erased, then resumes the erase operation.
- **Data# Polling and Toggle Bits**
  - Provides a software method of detecting the status of program or erase cycles
- **Unlock Bypass Program command**
  - Reduces overall programming time when issuing multiple program command sequences

### Hardware Features

- **Ready/Busy# output (RY/BY#)**
  - Hardware method for detecting program or erase cycle completion
- **Hardware reset pin (RESET#)**
  - Hardware method of resetting the internal state machine to the read mode
- **WP#/ACC input pin**
  - Write protect (WP#) function protects sectors 0, 1, 140, and 141, regardless of sector protect status
  - Acceleration (ACC) function accelerates program timing
- **Sector protection**
  - Hardware method to prevent any program or erase operation within a sector
  - Temporary Sector Unprotect allows changing data in protected sectors in-system

## General Description

The S71JLxxxHxx\_00 is a 64 megabit, 3.0 volt-only flash memory device, organized as 4,194,304 words of 16 bits each or 8,388,608 bytes of 8 bits each. Word mode Data appears on DQ15–DQ0; byte mode data appears on DQ7–DQ0. The device is designed to be programmed in-system with the standard 3.0 volt V<sub>CC</sub> supply, and can also be programmed in standard EPROM programmers.

Standard control pins—chip enable (CE#), write enable (WE#), and output enable (OE#)—control normal read and write operations, and avoid bus contention issues.

The device requires only a **single 3.0 volt power supply** for both read and write functions. Internally generated and regulated voltages are provided for the program and erase operations.

### Simultaneous Read/Write Operations with Zero Latency

The Simultaneous Read/Write architecture provides **simultaneous operation** by dividing the memory space into **four banks**, two 8 Mb banks with small and large sectors, and two 24 Mb banks of large sectors. Sector addresses are fixed, system software can be used to form user-defined bank groups.

During an Erase/Program operation, any of the three non-busy banks may be read from. Note that only two banks can operate simultaneously. The device can improve overall system performance by allowing a host system to program or erase in one bank, then immediately and simultaneously read from the other bank, with zero latency. This releases the system from waiting for the completion of program or erase operations.

The S71JLxxxHxx\_00 can be organized as both a top and bottom boot sector configuration.

Bank	Megabits	Sector Sizes
Bank 1	8 Mb	Eight 8 Kbyte/4 Kword, Fifteen 64 Kbyte/32 Kword
Bank 2	24 Mb	Forty-eight 64 Kbyte/32 Kword
Bank 3	24 Mb	Forty-eight 64 Kbyte/32 Kword
Bank 4	8 Mb	Eight 8 Kbyte/4 Kword, Fifteen 64 Kbyte/32 Kword

### S71JLxxxHxx\_00 Features

The **SecSi™ (Secured Silicon) Sector** is an extra 256 byte sector capable of being permanently locked by FASL or customers. The SecSi Customer Indicator Bit (DQ6) is permanently set to 1 if the part has been customer locked, permanently set to 0 if the part has been factory locked, and is 0 if customer lockable. This way, customer lockable parts can never be used to replace a factory locked part.

Factory locked parts provide several options. The SecSi Sector may store a secure, random 16 byte ESN (Electronic Serial Number), customer code (programmed through Spansion programming services), or both. Customer Lockable parts may utilize the SecSi Sector as bonus space, reading and writing like any other flash sector, or may permanently lock their own code there.

**DMS (Data Management Software)** allows systems to easily take advantage of the advanced architecture of the simultaneous read/write product line by allowing removal of EEPROM devices. DMS will also allow the system software to be simplified, as it will perform all functions necessary to modify data in file structures, as opposed to single-byte modifications. To write or update a particular piece of data (a phone number or configuration data, for example), the user only needs to state which piece of data is to be updated, and where the updated data is located in the system. This is an advantage compared to systems where user-written software must keep track of the old data location, status, logical to physical translation of the data onto the Flash memory device (or memory devices), and more. Using DMS, user-written software does not need to interface with the Flash memory directly. Instead, the user's software accesses the Flash memory by calling one of only six functions.

The device offers complete compatibility with the **JEDEC 42.4 single-power-supply Flash command set standard**. Commands are written to the command register using standard microprocessor write timings. Reading data out of the device is similar to reading from other Flash or EPROM devices.

The host system can detect whether a program or erase operation is complete by using the device **status bits**: RY/BY# pin, DQ7 (Data# Polling) and DQ6/DQ2 (toggle bits). After a program or erase cycle has been completed, the device automatically returns to the read mode.

The **sector erase architecture** allows memory sectors to be erased and reprogrammed without affecting the data contents of other sectors. The device is fully erased when shipped from the factory.

**Hardware data protection** measures include a low  $V_{CC}$  detector that automatically inhibits write operations during power transitions. The **hardware sector protection** feature disables both program and erase operations in any combination of the sectors of memory. This can be achieved in-system or via programming equipment.

The device offers two power-saving features. When addresses have been stable for a specified amount of time, the device enters the **automatic sleep mode**. The system can also place the device into the **standby mode**. Power consumption is greatly reduced in both modes.

## Product Selector Guide

Part Number		S7IJLxxxHxx_00		
Speed Option	Standard Voltage Range: $V_{CC} = 2.7-3.6\text{ V}$	55	70	85
Max Access Time (ns), $t_{ACC}$		55	70	85
CE# Access (ns), $t_{CE}$		55	70	85
OE# Access (ns), $t_{OE}$		25	30	40

## BLOCK DIAGRAM

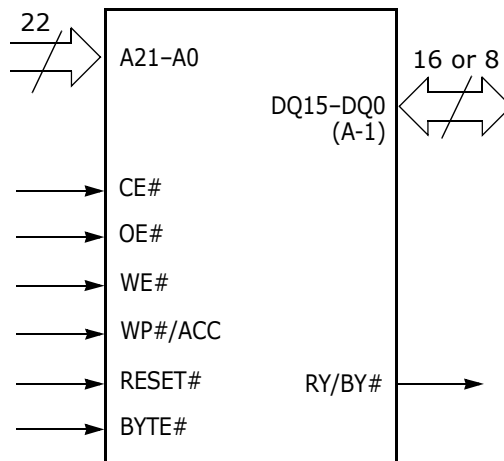

## Pin Description

A21-A0	=	22 Addresses
DQ14-DQ0	=	15 Data Inputs/Outputs (x16-only devices)
DQ15/A-1	=	DQ15 (Data Input/Output, word mode), A-1 (LSB Address Input, byte mode)
CE#	=	Chip Enable
OE#	=	Output Enable
WE#	=	Write Enable
WP#/ACC	=	Hardware Write Protect/ Acceleration Pin
		RESET#=Hardware Reset Pin, Active Low
BYTE#	=	Selects 8-bit or 16-bit mode
RY/BY#	=	Ready/Busy Output
V <sub>CC</sub>	=	3.0 volt-only single power supply (see Product Selector Guide for speed options and voltage supply tolerances)
V <sub>SS</sub>	=	Device Ground
NC	=	Pin Not Connected Internally

## LOGIC SYMBOL

## Device Bus Operations

This section describes the requirements and use of the device bus operations, which are initiated through the internal command register. The command register itself does not occupy any addressable memory location. The register is a latch used to store the commands, along with the address and data information needed to execute the command. The contents of the register serve as inputs to the internal state machine. The state machine outputs dictate the function of the device. Table 1 lists the device bus operations, the inputs and control levels they require, and the resulting output. The following subsections describe each of these operations in further detail.

**Table 1. S7IJLxxxHxx\_00 Device Bus Operations**

Operation	CE#	OE#	WE#	RESET#	WP#/ACC	Addresses (Note 2)	DQ15-DQ8		DQ7-DQ0
							BYTE# = V <sub>IH</sub>	BYTE# = V <sub>IL</sub>	
Read	L	L	H	H	L/H	A <sub>IN</sub>	D <sub>OUT</sub>	DQ14-DQ8 = High-Z, DQ15 = A-1	D <sub>OUT</sub>
Write	L	H	L	H	(Note 3)	A <sub>IN</sub>	D <sub>IN</sub>		D <sub>IN</sub>
Standby	V <sub>CC</sub> ± 0.3 V	X	X	V <sub>CC</sub> ± 0.3 V	L/H	X	High-Z	High-Z	High-Z
Output Disable	L	H	H	H	L/H	X	High-Z	High-Z	High-Z
Reset	X	X	X	L	L/H	X	High-Z	High-Z	High-Z
Sector Protect (Note 2)	L	H	L	V <sub>ID</sub>	L/H	SA, A6 = L, A1 = H, A0 = L	X	X	D <sub>IN</sub>
Sector Unprotect (Note 2)	L	H	L	V <sub>ID</sub>	(Note 3)	SA, A6 = H, A1 = H, A0 = L	X	X	D <sub>IN</sub>
Temporary Sector Unprotect	X	X	X	V <sub>ID</sub>	(Note 3)	A <sub>IN</sub>	D <sub>IN</sub>	High-Z	D <sub>IN</sub>

**Legend:** L = Logic Low = V<sub>IL</sub>, H = Logic High = V<sub>IH</sub>, V<sub>ID</sub> = 11.5–12.5 V, V<sub>HH</sub> = 9.0 ± 0.5 V, X = Don't Care, SA = Sector Address, A<sub>IN</sub> = Address In, D<sub>IN</sub> = Data In, D<sub>OUT</sub> = Data Out

**Notes:**

- Addresses are A21:A0 in word mode (BYTE# = V<sub>IH</sub>), A21:A-1 in byte mode (BYTE# = V<sub>IL</sub>).
- The sector protect and sector unprotect functions may also be implemented via programming equipment. See the "Sector/Sector Block Protection and Unprotection" section.
- If WP#/ACC = V<sub>IL</sub>, sectors 0, 1, 140, and 141 remain protected. If WP#/ACC = V<sub>IH</sub>, protection on sectors 0, 1, 140, and 141 depends on whether they were last protected or unprotected using the method described in "Sector/Sector Block Protection and Unprotection". If WP#/ACC = V<sub>HH</sub>, all sectors will be unprotected.

## Word/Byte Configuration

The BYTE# pin controls whether the device data I/O pins operate in the byte or word configuration. If the BYTE# pin is set at logic '1', the device is in word configuration, DQ15–DQ0 are active and controlled by CE# and OE#.

If the BYTE# pin is set at logic '0', the device is in byte configuration, and only data I/O pins DQ7–DQ0 are active and controlled by CE# and OE#. The data I/O pins DQ14–DQ8 are tri-stated, and the DQ15 pin is used as an input for the LSB (A-1) address function.

## Requirements for Reading Array Data

To read array data from the outputs, the system must drive the CE# and OE# pins to  $V_{IL}$ . CE# is the power control and selects the device. OE# is the output control and gates array data to the output pins. WE# should remain at  $V_{IH}$ . The BYTE# pin determines whether the device outputs array data in words or bytes.

The internal state machine is set for reading array data upon device power-up, or after a hardware reset. This ensures that no spurious alteration of the memory content occurs during the power transition. No command is necessary in this mode to obtain array data. Standard microprocessor read cycles that assert valid addresses on the device address inputs produce valid data on the device data outputs. Each bank remains enabled for read access until the command register contents are altered.

Refer to the AC "[Read-Only Operations](#)" section table for timing specifications and to [14](#) for the timing diagram.  $I_{CC1}$  in the DC Characteristics table represents the active current specification for reading array data.

## Writing Commands/Command Sequences

To write a command or command sequence (which includes programming data to the device and erasing sectors of memory), the system must drive WE# and CE# to  $V_{IL}$ , and OE# to  $V_{IH}$ .

For program operations, the BYTE# pin determines whether the device accepts program data in bytes or words. Refer to "Word/Byte Configuration" for more information.

The device features an **Unlock Bypass** mode to facilitate faster programming. Once a bank enters the Unlock Bypass mode, only two write cycles are required to program a word or byte, instead of four. The "Byte/Word Program Command Sequence" section has details on programming data to the device using both standard and Unlock Bypass command sequences.

An erase operation can erase one sector, multiple sectors, or the entire device. [Table 3](#) indicates the address space that each sector occupies. Similarly, a "sector address" is the address bits required to uniquely select a sector. The "Command Definitions" section has details on erasing a sector or the entire chip, or suspending/resuming the erase operation.

The device address space is divided into four banks. A "bank address" is the address bits required to uniquely select a bank.

$I_{CC2}$  in the DC Characteristics table represents the active current specification for the write mode. The "[AC Characteristics](#)" section contains timing specification tables and timing diagrams for write operations.

### Accelerated Program Operation

The device offers accelerated program operations through the ACC function. This is one of two functions provided by the WP#/ACC pin. This function is primarily intended to allow faster manufacturing throughput at the factory.

If the system asserts  $V_{HH}$  on this pin, the device automatically enters the aforementioned Unlock Bypass mode, temporarily unprotects any protected sectors, and uses the higher voltage on the pin to reduce the time required for program operations. The system would use a two-cycle program command sequence as required by the Unlock Bypass mode. Removing  $V_{HH}$  from the WP#/ACC pin returns the device to normal operation. *Note that  $V_{HH}$  must not be asserted on WP#/ACC for operations other than accelerated programming, or device damage may result. In addition, the WP#/ACC pin must not be left floating or unconnected; inconsistent behavior of the device may result.* See "Write Protect (WP#)" on page 51. for related information.

### Autoselect Functions

If the system writes the autoselect command sequence, the device enters the autoselect mode. The system can then read autoselect codes from the internal register (which is separate from the memory array) on DQ15–DQ0. Standard read cycle timings apply in this mode. Refer to the "Autoselect Mode" section and "Autoselect Command Sequence" section sections for more information.

### Simultaneous Read/Write Operations with Zero Latency

This device is capable of reading data from one bank of memory while programming or erasing in the other bank of memory. An erase operation may also be suspended to read from or program to another location within the same bank (except the sector being erased). [Figure 21](#) shows how read and write cycles may be initiated for simultaneous operation with zero latency.  $I_{CC6}$  and  $I_{CC7}$  in the "DC Characteristics" section table represent the current specifications for read-while-program and read-while-erase, respectively.

### Standby Mode

When the system is not reading or writing to the device, it can place the device in the standby mode. In this mode, current consumption is greatly reduced, and the outputs are placed in the high impedance state, independent of the OE# input.

The device enters the CMOS standby mode when the CE# and RESET# pins are both held at  $V_{CC} \pm 0.3$  V. (Note that this is a more restricted voltage range than  $V_{IH}$ .) If CE# and RESET# are held at  $V_{IH}$ , but not within  $V_{CC} \pm 0.3$  V, the device will be in the standby mode, but the standby current will be greater. The device requires standard access time ( $t_{CE}$ ) for read access when the device is in either of these standby modes, before it is ready to read data.

If the device is deselected during erasure or programming, the device draws active current until the operation is completed.

$I_{CC3}$  in the "DC Characteristics" section table represents the standby current specification.

### Automatic Sleep Mode

The automatic sleep mode minimizes Flash device energy consumption. The device automatically enables this mode when addresses remain stable for  $t_{ACC} + 30$  ns. The automatic sleep mode is independent of the CE#, WE#, and OE# con-

trol signals. Standard address access timings provide new data when addresses are changed. While in sleep mode, output data is latched and always available to the system.  $I_{CC5}$  in the "DC Characteristics" section table represents the automatic sleep mode current specification.

### RESET#: Hardware Reset Pin

The RESET# pin provides a hardware method of resetting the device to reading array data. When the RESET# pin is driven low for at least a period of  $t_{RP}$ , the device immediately terminates any operation in progress, tristates all output pins, and ignores all read/write commands for the duration of the RESET# pulse. The device also resets the internal state machine to reading array data. The operation that was interrupted should be reinitiated once the device is ready to accept another command sequence, to ensure data integrity.

Current is reduced for the duration of the RESET# pulse. When RESET# is held at  $V_{SS} \pm 0.3$  V, the device draws CMOS standby current ( $I_{CC4}$ ). If RESET# is held at  $V_{IL}$  but not within  $V_{SS} \pm 0.3$  V, the standby current will be greater.

The RESET# pin may be tied to the system reset circuitry. A system reset would thus also reset the Flash memory, enabling the system to read the boot-up firmware from the Flash memory.

If RESET# is asserted during a program or erase operation, the RY/BY# pin remains a "0" (busy) until the internal reset operation is complete, which requires a time of  $t_{READY}$  (during Embedded Algorithms). The system can thus monitor RY/BY# to determine whether the reset operation is complete. If RESET# is asserted when a program or erase operation is not executing (RY/BY# pin is "1"), the reset operation is completed within a time of  $t_{READY}$  (not during Embedded Algorithms). The system can read data  $t_{RH}$  after the RESET# pin returns to  $V_{IH}$ .

Refer to the "AC Characteristics" section tables for RESET# parameters and to 15 for the timing diagram.

### Output Disable Mode

When the OE# input is at  $V_{IH}$ , output from the device is disabled. The output pins are placed in the high impedance state.

3	100, 101, 110
4	111

Table 4. SecSi™ Sector Addresses

Device	Sector Size	(x8) Address Range	(x16) Address Range
S29JL064H	256 bytes	000000h–0000FFh	000000h–00007Fh

### Autoselect Mode

The autoselect mode provides manufacturer and device identification, and sector protection verification, through identifier codes output on DQ7–DQ0. This mode is primarily intended for programming equipment to automatically match a device to be programmed with its corresponding programming algorithm. However, the autoselect codes can also be accessed in-system through the command register.

### Sector/Sector Block Protection and Unprotection

(Note: For the following discussion, the term “sector” applies to both sectors and sector blocks. A sector block consists of two or more adjacent sectors that are protected or unprotected at the same time (see [Table 5](#)).

The hardware sector protection feature disables both program and erase operations in any sector. The hardware sector unprotection feature re-enables both program and erase operations in previously protected sectors. Sector protection/unprotection can be implemented via two methods.

**Table 5. S7IJLxxxHxx\_00 Boot Sector/Sector Block Addresses for Protection/Unprotection**

Sector	A21–A12	Sector/ Sector Block Size
SA0	000000000	8 Kbytes

Sector protect/Sector Unprotect requires  $V_{ID}$  on the RESET# pin only, and can be implemented either in-system or via programming equipment. [Figure 2](#) shows the algorithms and [Figure 26](#) shows the timing diagram. For sector unprotect, all unprotected sectors must first be protected prior to the first sector unprotect write cycle. *Note that the sector unprotect algorithm unprotects all sectors in parallel. All previously protected sectors must be individually re-protected.* To change data in protected sectors efficiently, the temporary sector unprotect function is available. See ["Temporary Sector Unprotect"](#).

The device is shipped with all sectors unprotected. Optional Spansion programming service enable programming and protecting sectors at the factory prior to shipping the device. Contact your local sales office for details.

It is possible to determine whether a sector is protected or unprotected. See the ["Autoselect Mode"](#) section section for details.

### Write Protect (WP#)

The Write Protect function provides a hardware method of protecting without using  $V_{ID}$ . This function is one of two provided by the WP#/ACC pin.

If the system asserts  $V_{IL}$  on the WP#/ACC pin, the device disables program and erase functions in sectors 0, 1, 140, and 141, independently of whether those sectors were protected or unprotected using the method described in "Sector/Sector Block Protection and Unprotection".

If the system asserts  $V_{IH}$  on the WP#/ACC pin, the device reverts to whether sectors 0, 1, 140, and 141 were last set to be protected or unprotected. That is, sector protection or unprotection for these sectors depends on whether they were last protected or unprotected using the method described in "Sector/Sector Block Protection and Unprotection".

Note that the WP#/ACC pin must not be left floating or unconnected; inconsistent behavior of the device may result.

**Table 6. WP#/ACC Modes**

WP# Input Voltage	Device Mode
$V_{IL}$	Disables programming and erasing in SA0, SA1, SA140, and SA141
$V_{IH}$	Enables programming and erasing in SA0, SA1, SA140, and SA141, dependent on whether they were last protected or unprotected.
$V_{HH}$	Enables accelerated programming (ACC). See "Accelerated Program Operation" on page 44..

### Temporary Sector Unprotect

(Note: For the following discussion, the term "sector" applies to both sectors and sector blocks. A sector block consists of two or more adjacent sectors that are protected or unprotected at the same time (see Table 5).

This feature allows temporary unprotection of previously protected sectors to change data in-system. The Temporary Sector Unprotect mode is activated by setting the RESET# pin to " $V_{ID}$ " section. During this mode, formerly protected sectors can be programmed or erased by selecting the sector addresses. Once  $V_{ID}$  is removed from the RESET# pin, all the previously protected sectors are protected again. Figure 2 shows the algorithm, and Figure 25 shows the timing diagrams, for this feature. If the WP#/ACC pin is at  $V_{IL}$ , sectors 0, 1, 140, and 141 will remain protected during the Temporary sector Unprotect mode.

**Notes:**

1. All protected sectors unprotected (If WP#/ACC =  $V_{IL}$ , sectors 0, 1, 140, and 141 will remain protected).
2. All previously protected sectors are protected once again.

**Figure 1. Temporary Sector Unprotect Operation**

Figure 2. In-System Sector Protect/Unprotect Algorithms

### SecSi™ (Secured Silicon) Sector Flash Memory Region

The SecSi (Secured Silicon) Sector feature provides a Flash memory region that enables permanent part identification through an Electronic Serial Number (ESN). The SecSi Sector is 256 bytes in length, and uses a SecSi Sector Indicator

Bit (DQ7) to indicate whether or not the SecSi Sector is locked when shipped from the factory. This bit is permanently set at the factory and cannot be changed, which prevents cloning of a factory locked part. This ensures the security of the ESN once the product is shipped to the field.

The product is available with the SecSi Sector either factory locked or customer lockable. The factory-locked version is always protected when shipped from the factory, and has the SecSi (Secured Silicon) Sector Indicator Bit permanently set to a "1." The customer-lockable version is shipped with the SecSi Sector unprotected, allowing customers to utilize the that sector in any manner they choose. The customer-lockable version has the SecSi (Secured Silicon) Sector Indicator Bit permanently set to a "0." Thus, the SecSi Sector Indicator Bit prevents customer-lockable devices from being used to replace devices that are factory locked. The SecSi Customer Indicator Bit (DQ6) is permanently set to 1 if the part has been customer locked, permanently set to 0 if the part has been factory locked, and is 0 if customer lockable.

The system accesses the SecSi Sector Secure through a command sequence (see "Enter SecSi™ Sector/Exit SecSi Sector Command Sequence"). After the system has written the Enter SecSi Sector command sequence, it may read the SecSi Sector by using the addresses normally occupied by the boot sectors. This mode of operation continues until the system issues the Exit SecSi Sector command sequence, or until power is removed from the device. On power-up, or following a hardware reset, the device reverts to sending commands to the first 256 bytes of Sector 0. *Note that the ACC function and unlock bypass modes are not available when the SecSi Sector is enabled.*

**Factory Locked: SecSi Sector Programmed and Protected At the Factory**

In a factory locked device, the SecSi Sector is protected when the device is shipped from the factory. The SecSi Sector cannot be modified in any way. The device is preprogrammed with both a random number and a secure ESN. The 8-word random number is at addresses 000000h–000007h in word mode (or 000000h–00000Fh in byte mode). The secure ESN is programmed in the next 8 words at addresses 000008h–00000Fh (or 000010h–00001Fh in byte mode). The device is available preprogrammed with one of the following:

- A random, secure ESN only
- Customer code through Spansion programming services
- Both a random, secure ESN and customer code through Spansion programming services

Contact an your local sales office for details on using Spansion programming services.

**Customer Lockable: SecSi Sector NOT Programmed or Protected At the Factory**

If the security feature is not required, the SecSi Sector can be treated as an additional Flash memory space. The SecSi Sector can be read any number of times, but can be programmed and locked only once. Note that the accelerated programming (ACC) and unlock bypass functions are not available when programming the SecSi Sector.

The SecSi Sector area can be protected using one of the following procedures:

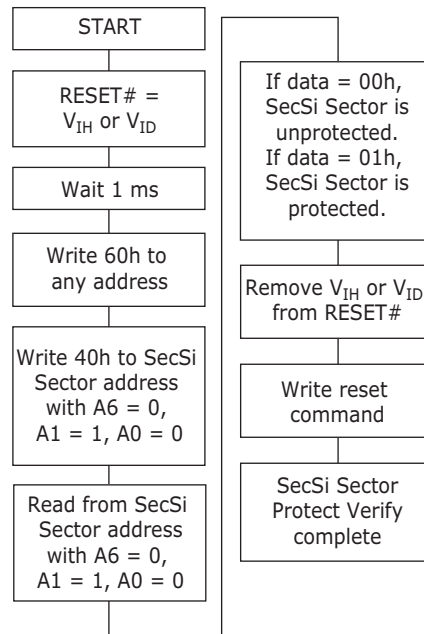

- Write the three-cycle Enter SecSi Sector Region command sequence, and then follow the in-system sector protect algorithm as shown in [Figure 2](#), except that *RESET#* may be at either  $V_{IH}$  or  $V_{ID}$ . This allows in-system protec-

tion of the SecSi Sector Region without raising any device pin to a high voltage. Note that this method is only applicable to the SecSi Sector.

- To verify the protect/unprotect status of the SecSi Sector, follow the algorithm shown in [Figure 3](#).

Once the SecSi Sector is locked and verified, the system must write the Exit SecSi Sector Region command sequence to return to reading and writing the remainder of the array.

The SecSi Sector lock must be used with caution since, once locked, there is no procedure available for unlocking the SecSi Sector area and none of the bits in the SecSi Sector memory space can be modified in any way.

**Figure 3. SecSi Sector Protect Verify**

## Hardware Data Protection

The command sequence requirement of unlock cycles for programming or erasing provides data protection against inadvertent writes (refer to [Table 11](#) for command definitions). In addition, the following hardware data protection measures prevent accidental erasure or programming, which might otherwise be caused by spurious system level signals during  $V_{CC}$  power-up and power-down transitions, or from system noise.

### Low $V_{CC}$ Write Inhibit

When  $V_{CC}$  is less than  $V_{LKO}$ , the device does not accept any write cycles. This protects data during  $V_{CC}$  power-up and power-down. The command register and all internal program/erase circuits are disabled, and the device resets to the read mode. Subsequent writes are ignored until  $V_{CC}$  is greater than  $V_{LKO}$ . The system must provide the proper signals to the control pins to prevent unintentional writes when  $V_{CC}$  is greater than  $V_{LKO}$ .

### Write Pulse "Glitch" Protection

Noise pulses of less than 5 ns (typical) on OE#, CE# or WE# do not initiate a write cycle.

### Logical Inhibit

Write cycles are inhibited by holding any one of OE# = V<sub>IL</sub>, CE# = V<sub>IH</sub> or WE# = V<sub>IH</sub>. To initiate a write cycle, CE# and WE# must be a logical zero while OE# is a logical one.

### Power-Up Write Inhibit

If WE# = CE# = V<sub>IL</sub> and OE# = V<sub>IH</sub> during power up, the device does not accept commands on the rising edge of WE#. The internal state machine is automatically reset to the read mode on power-up.

## Common Flash Memory Interface (CFI)

The Common Flash Interface (CFI) specification outlines device and host system software interrogation handshake, which allows specific vendor-specified software algorithms to be used for entire families of devices. Software support can then be device-independent, JEDEC ID-independent, and forward- and backward-compatible for the specified flash device families. Flash vendors can standardize their existing interfaces for long-term compatibility.

This device enters the CFI Query mode when the system writes the CFI Query command, 98h, to address 55h in word mode (or address AAh in byte mode), any time the device is ready to read array data. The system can read CFI information at the addresses given in Tables 7–10. To terminate reading CFI data, the system must write the reset command. The CFI Query mode is not accessible when the device is executing an Embedded Program or embedded Erase algorithm.

The system can also write the CFI query command when the device is in the autoselect mode. The device enters the CFI query mode, and the system can read CFI data at the addresses given in Tables 7–10. The system must write the reset command to reading array data.

For further information, please refer to the CFI Specification and CFI Publication 100. Contact your local sales office for copies of these documents.

**Table 7. CFI Query Identification String**

Addresses (Word Mode)	Addresses (Byte Mode)	Data	Description
10h 11h 12h	20h 22h 24h	0051h 0052h 0059h	Query Unique ASCII string "QRY"
13h 14h	26h 28h	0002h 0000h	Primary OEM Command Set
15h 16h	2Ah 2Ch	0040h 0000h	Address for Primary Extended Table
17h 18h	2Eh 30h	0000h 0000h	Alternate OEM Command Set (00h = none exists)
19h 1Ah	32h 34h	0000h 0000h	Address for Alternate OEM Extended Table (00h = none exists)

**Table 8. System Interface String**

Addresses (Word Mode)	Addresses (Byte Mode)	Data	Description
1Bh	36h	0027h	V <sub>CC</sub> Min. (write/erase) D7–D4: volt, D3–D0: 100 millivolt
1Ch	38h	0036h	V <sub>CC</sub> Max. (write/erase) D7–D4: volt, D3–D0: 100 millivolt
1Dh	3Ah	0000h	V <sub>PP</sub> Min. voltage (00h = no V <sub>PP</sub> pin present)
1Eh	3Ch	0000h	V <sub>PP</sub> Max. voltage (00h = no V <sub>PP</sub> pin present)
1Fh	3Eh	0003h	Typical timeout per single byte/word write 2 <sup>n</sup> μs
20h	40h	0000h	Typical timeout for Min. size buffer write 2 <sup>n</sup> μs (00h = not supported)
21h	42h	0009h	Typical timeout per individual block erase 2 <sup>n</sup> ms
22h	44h	0000h	Typical timeout for full chip erase 2 <sup>n</sup> ms (00h = not supported)
23h	46h	0005h	Max. timeout for byte/word write 2 <sup>n</sup> times typical
24h	48h	0000h	Max. timeout for buffer write 2 <sup>n</sup> times typical
25h	4Ah	0004h	Max. timeout per individual block erase 2 <sup>n</sup> times typical
26h	4Ch	0000h	Max. timeout for full chip erase 2 <sup>n</sup> times typical (00h = not supported)

57h	AEh	0004h	Bank Organization 00 = Data at 4Ah is zero, X = Number of Banks
58h	B0h	0017h	Bank 1 Region Information X = Number of Sectors in Bank 1
59h	B2h	0030h	Bank 2 Region Information X = Number of Sectors in Bank 2
5Ah	B4h	0030h	Bank 3 Region Information X = Number of Sectors in Bank 3
5Bh	B6h	0017h	Bank 4 Region Information X = Number of Sectors in Bank 4

## Command Definitions

Writing specific address and data commands or sequences into the command register initiates device operations. [Table 11](#) defines the valid register command sequences. *Writing incorrect address and data values or writing them in the improper sequence may place the device in an unknown state. A reset command is then required to return the device to reading array data.*

All addresses are latched on the falling edge of WE# or CE#, whichever happens later. All data is latched on the rising edge of WE# or CE#, whichever happens first. Refer to the "[AC Characteristics](#)" section for timing diagrams.

### Reading Array Data

The device is automatically set to reading array data after device power-up. No commands are required to retrieve data. Each bank is ready to read array data after completing an Embedded Program or Embedded Erase algorithm.

After the device accepts an Erase Suspend command, the corresponding bank enters the erase-suspend-read mode, after which the system can read data from any non-erase-suspended sector within the same bank. The system can read array data using the standard read timing, except that if it reads at an address within erase-suspended sectors, the device outputs status data. After completing a programming operation in the Erase Suspend mode, the system may once again read array data with the same exception. See the "[Erase Suspend/Erased Resume Commands](#)" section section for more information.

The system *must* issue the reset command to return a bank to the read (or erase-suspend-read) mode if DQ5 goes high during an active program or erase operation, or if the bank is in the autoselect mode. See the next section, "[Reset Command](#)" section, for more information.

See also "[Requirements for Reading Array Data](#)" section in the "[Device Bus Operations](#)" section section for more information. The "[Read-Only Operations](#)" section table provides the read parameters, and [14](#) shows the timing diagram.

### Reset Command

Writing the reset command resets the banks to the read or erase-suspend-read mode. Address bits are don't cares for this command.

The reset command may be written between the sequence cycles in an erase command sequence before erasing begins. This resets the bank to which the system was writing to the read mode. Once erasure begins, however, the device ignores reset commands until the operation is complete.

The reset command may be written between the sequence cycles in a program command sequence before programming begins. This resets the bank to which the system was writing to the read mode. If the program command sequence is written to a bank that is in the Erase Suspend mode, writing the reset command returns that bank to the erase-suspend-read mode. Once programming begins, however, the device ignores reset commands until the operation is complete.

The reset command may be written between the sequence cycles in an autoselect command sequence. Once in the autoselect mode, the reset command must be written to return to the read mode. If a bank entered the autoselect mode while in the Erase Suspend mode, writing the reset command returns that bank to the erase-suspend-read mode.

If DQ5 goes high during a program or erase operation, writing the reset command returns the banks to the read mode (or erase-suspend-read mode if that bank was in Erase Suspend).

### Autoselect Command Sequence

The autoselect command sequence allows the host system to access the manufacturer and device codes, and determine whether or not a sector is protected. The autoselect command sequence may be written to an address within a bank that is either in the read or erase-suspend-read mode. The autoselect command may not be written while the device is actively programming or erasing in another bank.

The autoselect command sequence is initiated by first writing two unlock cycles. This is followed by a third write cycle that contains the bank address and the autoselect command. The bank then enters the autoselect mode. The system may read any number of autoselect codes without reinitiating the command sequence.

Table 11 shows the address and data requirements. To determine sector protection information, the system must write to the appropriate bank address (BA) and sector address (SA). Table 3 shows the address range and bank number associated with each sector.

The system must write the reset command to return to the read mode (or erase-suspend-read mode if the bank was previously in Erase Suspend).

### Enter SecSi™ Sector/Exit SecSi Sector Command Sequence

The SecSi Sector region provides a secured data area containing a random, sixteen-byte electronic serial number (ESN). The system can access the SecSi Sector region by issuing the three-cycle Enter SecSi Sector command sequence. The device continues to access the SecSi Sector region until the system issues the four-cycle Exit SecSi Sector command sequence. The Exit SecSi Sector command sequence returns the device to normal operation. The SecSi Sector is not accessible when the device is executing an Embedded Program or embedded Erase algorithm. Table 11 shows the address and data requirements for both command sequences. See also "SecSi™ (Secured Silicon) Sector Flash Memory Region" for further information. *Note that the ACC function and unlock bypass modes are not available when the SecSi Sector is enabled.*

### Byte/Word Program Command Sequence

The system may program the device by word or byte, depending on the state of the BYTE# pin. Programming is a four-bus-cycle operation. The program command sequence is initiated by writing two unlock write cycles, followed by the program set-up command. The program address and data are written next, which in turn initiate the Embedded Program algorithm. The system is *not* required to provide further controls or timings. The device automatically provides internally generated program pulses and verifies the programmed cell margin. Table 11 shows the address and data requirements for the byte program command sequence.

When the Embedded Program algorithm is complete, that bank then returns to the read mode and addresses are no longer latched. The system can determine the status of the program operation by using DQ7, DQ6, or RY/BY#. Refer to the "Write Operation Status" section section for information on these status bits.

Any commands written to the device during the Embedded Program Algorithm are ignored. Note that a **hardware reset** immediately terminates the program

operation. The program command sequence should be reinitiated once that bank has returned to the read mode, to ensure data integrity. *Note that the SecSi Sector, autoselect, and CFI functions are unavailable when a program operation is in progress.*

Programming is allowed in any sequence and across sector boundaries. **A bit cannot be programmed from "0" back to a "1."** Attempting to do so may cause that bank to set DQ5 = 1, or cause the DQ7 and DQ6 status bits to indicate the operation was successful. However, a succeeding read will show that the data is still "0." Only erase operations can convert a "0" to a "1."

### Unlock Bypass Command Sequence

The unlock bypass feature allows the system to program bytes or words to a bank faster than using the standard program command sequence. The unlock bypass command sequence is initiated by first writing two unlock cycles. This is followed by a third write cycle containing the unlock bypass command, 20h. That bank then enters the unlock bypass mode. A two-cycle unlock bypass program command sequence is all that is required to program in this mode. The first cycle in this sequence contains the unlock bypass program command, A0h; the second cycle contains the program address and data. Additional data is programmed in the same manner. This mode dispenses with the initial two unlock cycles required in the standard program command sequence, resulting in faster total programming time. [Table 11](#) shows the requirements for the command sequence.

During the unlock bypass mode, only the Unlock Bypass Program and Unlock Bypass Reset commands are valid. To exit the unlock bypass mode, the system must issue the two-cycle unlock bypass reset command sequence. (See [Table 12](#)).

The device offers accelerated program operations through the WP#/ACC pin. When the system asserts  $V_{HH}$  on the WP#/ACC pin, the device automatically enters the Unlock Bypass mode. The system may then write the two-cycle Unlock Bypass program command sequence. The device uses the higher voltage on the WP#/ACC pin to accelerate the operation. *Note that the WP#/ACC pin must not be at  $V_{HH}$  for any operation other than accelerated programming, or device damage may result. In addition, the WP#/ACC pin must not be left floating or unconnected; inconsistent behavior of the device may result.*

[4](#) illustrates the algorithm for the program operation. Refer to the "[Erase and Program Operations](#)" section table in the AC Characteristics section for parameters, and [Figure 18](#) for timing diagrams.

Note: See Table 11 for program command sequence.

Figure 4. Program Operation

### Chip Erase Command Sequence

Chip erase is a six bus cycle operation. The chip erase command sequence is initiated by writing two unlock cycles, followed by a set-up command. Two additional unlock write cycles are then followed by the chip erase command, which in turn invokes the Embedded Erase algorithm. The device does *not* require the system to preprogram prior to erase. The Embedded Erase algorithm automatically preprograms and verifies the entire memory for an all zero data pattern prior to electrical erase. The system is not required to provide any controls or timings during these operations. Table 11 shows the address and data requirements for the chip erase command sequence.

When the Embedded Erase algorithm is complete, that bank returns to the read mode and addresses are no longer latched. The system can determine the status of the erase operation by using DQ7, DQ6, DQ2, or RY/BY#. Refer to the "Write Operation Status" section section for information on these status bits.

Any commands written during the chip erase operation are ignored. However, note that a **hardware reset** immediately terminates the erase operation. If that occurs, the chip erase command sequence should be reinitiated once that bank has returned to reading array data, to ensure data integrity. *Note that the SecSi Sector, autoselect, and CFI functions are unavailable when an erase operation is in progress.*

5 illustrates the algorithm for the erase operation. Refer to the "[Erase and Program Operations](#)" section tables in the AC Characteristics section for parameters, and [Figure 20](#) section for timing diagrams.

## Sector Erase Command Sequence

Sector erase is a six bus cycle operation. The sector erase command sequence is initiated by writing two unlock cycles, followed by a set-up command. Two additional unlock cycles are written, and are then followed by the address of the sector to be erased, and the sector erase command. [Table 11](#) shows the address and data requirements for the sector erase command sequence.

The device does *not* require the system to preprogram prior to erase. The Embedded Erase algorithm automatically programs and verifies the entire sector for an all zero data pattern prior to electrical erase. The system is not required to provide any controls or timings during these operations.

After the command sequence is written, a sector erase time-out of 80  $\mu$ s occurs. During the time-out period, additional sector addresses and sector erase commands may be written. Loading the sector erase buffer may be done in any sequence, and the number of sectors may be from one sector to all sectors. The time between these additional cycles must be less than 80  $\mu$ s, otherwise erasure may begin. Any sector erase address and command following the exceeded time-out may or may not be accepted. It is recommended that processor interrupts be disabled during this time to ensure all commands are accepted. The interrupts can be re-enabled after the last Sector Erase command is written. **Any command other than Sector Erase or Erase Suspend during the time-out period resets that bank to the read mode.** The system must rewrite the command sequence and any additional addresses and commands.

The system can monitor DQ3 to determine if the sector erase timer has timed out (See the section on DQ3: Sector Erase Timer.). The time-out begins from the rising edge of the final WE# or CE# pulse (first rising edge) in the command sequence.

When the Embedded Erase algorithm is complete, the bank returns to reading array data and addresses are no longer latched. Note that while the Embedded Erase operation is in progress, the system can read data from the non-erasing bank. The system can determine the status of the erase operation by reading DQ7, DQ6, DQ2, or RY/BY# in the erasing bank. Refer to the "[Write Operation Status](#)" section section for information on these status bits.

Once the sector erase operation has begun, only the Erase Suspend command is valid. All other commands are ignored. However, note that a **hardware reset** immediately terminates the erase operation. If that occurs, the sector erase command sequence should be reinitiated once that bank has returned to reading array data, to ensure data integrity. *Note that the SecSi Sector, autoselect, and CFI functions are unavailable when an erase operation is in progress.*

5 illustrates the algorithm for the erase operation. Refer to the "[Erase and Program Operations](#)" section tables in the AC Characteristics section for parameters, and [Figure 20](#) section for timing diagrams.

**Notes:**

1. See [Table 11](#) for erase command sequence.
2. See the section on DQ3 for information on the sector erase timer.

**Figure 5. Erase Operation**

**Erase Suspend/Eraser Resume Commands**

The Erase Suspend command, B0h, allows the system to interrupt a sector erase operation and then read data from, or program data to, any sector not selected for erasure. The bank address is required when writing this command. This command is valid only during the sector erase operation, including the 80 μs time-out period during the sector erase command sequence. The Erase Suspend command is ignored if written during the chip erase operation or Embedded Program algorithm. The bank address must contain one of the sectors currently selected for erase.

When the Erase Suspend command is written during the sector erase operation, the device requires a maximum of 20 μs to suspend the erase operation. However, when the Erase Suspend command is written during the sector erase time-out, the device immediately terminates the time-out period and suspends the erase operation.

After the erase operation has been suspended, the bank enters the erase-suspend-read mode. The system can read data from or program data to any sector not selected for erasure. (The device “erase suspends” all sectors selected for erasure.) Reading at any address within erase-suspended sectors produces status information on DQ7–DQ0. The system can use DQ7, or DQ6 and DQ2 together, to determine if a sector is actively erasing or is erase-suspended. Refer to the “[Write Operation Status](#)” section section for information on these status bits.

After an erase-suspended program operation is complete, the bank returns to the erase-suspend-read mode. The system can determine the status of the program

operation using the DQ7 or DQ6 status bits, just as in the standard Byte Program operation. Refer to the "Write Operation Status" section section for more information.

In the erase-suspend-read mode, the system can also issue the autoselect command sequence. The device allows reading autoselect codes even at addresses within erasing sectors, since the codes are not stored in the memory array. When the device exits the autoselect mode, the device reverts to the Erase Suspend mode, and is ready for another valid operation. Refer to the "Autoselect Mode" section and "Autoselect Command Sequence" section sections for details.

To resume the sector erase operation, the system must write the Erase Resume command. The bank address of the erase-suspended bank is required when writing this command. Further writes of the Resume command are ignored. Another Erase Suspend command can be written after the chip has resumed erasing.

**Table II. S29JL064H Command Definitions**

Command Sequence (Note 1)		Cycles	Bus Cycles (Notes 2–5)												
			First		Second		Third		Fourth		Fifth		Sixth		
			Addr	Data	Addr	Data	Addr	Data	Addr	Data	Addr	Data	Addr	Data

CFI Query (Note 16)	Word	1	55	98											
	Byte		AA												

**Legend:**

X = Don't care

RA = Address of the memory location to be read.

RD = Data read from location RA during read operation.

PA = Address of the memory location to be programmed. Addresses latch on the falling edge of the WE# or CE# pulse, whichever happens later.

PD = Data to be programmed at location PA. Data latches on the rising edge of WE# or CE# pulse, whichever happens first.

SA = Address of the sector to be verified (in autoselect mode) or erased. Address bits A21–A12 uniquely select any sector. Refer to Table 3 for information on sector addresses.

BA = Address of the bank that is being switched to autoselect mode, is in bypass mode, or is being erased. A21–A19 uniquely select a bank.

**Notes:**

1. See [Table 1](#) for description of bus operations.
2. All values are in hexadecimal.
3. Except for the read cycle and the fourth, fifth, and sixth cycle of the autoselect command sequence, all bus cycles are write cycles.
4. Data bits DQ15–DQ8 are don't care in command sequences, except for RD and PD.
5. Unless otherwise noted, address bits A21–A11 are don't cares for unlock and command cycles, unless SA or PA is required.
6. No unlock or command cycles required when bank is reading array data.
7. The Reset command is required to return to the read mode (or to the erase-suspend-read mode if previously in Erase Suspend) when a bank is in the autoselect mode, or if DQ5 goes high (while the bank is providing status information).
8. The fourth cycle of the autoselect command sequence is a read cycle. The system must provide the bank address to obtain the manufacturer ID, device ID, or SecSi Sector factory protect information. Data bits DQ15–DQ8 are don't care. While reading the autoselect addresses, the bank address must be the same until a reset command is given. See the "[Autoselect Command Sequence](#)" section section for more information.
9. The device ID must be read across the fourth, fifth, and sixth cycles.
10. The data is 80h for factory locked, 40h for customer locked, and 00h for not factory/customer locked.
11. The data is 00h for an unprotected sector/sector block and 01h for a protected sector/sector block.
12. The Unlock Bypass command is required prior to the Unlock Bypass Program command.
13. The Unlock Bypass Reset command is required to return to the read mode when the bank is in the unlock bypass mode.
14. The system may read and program in non-erasing sectors, or enter the autoselect mode, when in the Erase Suspend mode. The Erase Suspend command is valid only during a sector erase operation, and requires the bank address.
15. The Erase Resume command is valid only during the Erase Suspend mode, and requires the bank address.
16. Command is valid when device is ready to read array data or when device is in autoselect mode.

## Write Operation Status

The device provides several bits to determine the status of a program or erase operation: DQ2, DQ3, DQ5, DQ6, and DQ7. [Table 12](#) and the following subsections describe the function of these bits. DQ7 and DQ6 each offer a method for determining whether a program or erase operation is complete or in progress. The device also provides a hardware-based output signal, RY/BY#, to determine whether an Embedded Program or Erase operation is in progress or has been completed.

### DQ7: Data# Polling

The Data# Polling bit, DQ7, indicates to the host system whether an Embedded Program or Erase algorithm is in progress or completed, or whether a bank is in Erase Suspend. Data# Polling is valid after the rising edge of the final WE# pulse in the command sequence.

During the Embedded Program algorithm, the device outputs on DQ7 the complement of the datum programmed to DQ7. This DQ7 status also applies to programming during Erase Suspend. When the Embedded Program algorithm is complete, the device outputs the datum programmed to DQ7. The system must provide the program address to read valid status information on DQ7. If a program address falls within a protected sector, Data# Polling on DQ7 is active for approximately 1  $\mu$ s, then that bank returns to the read mode.

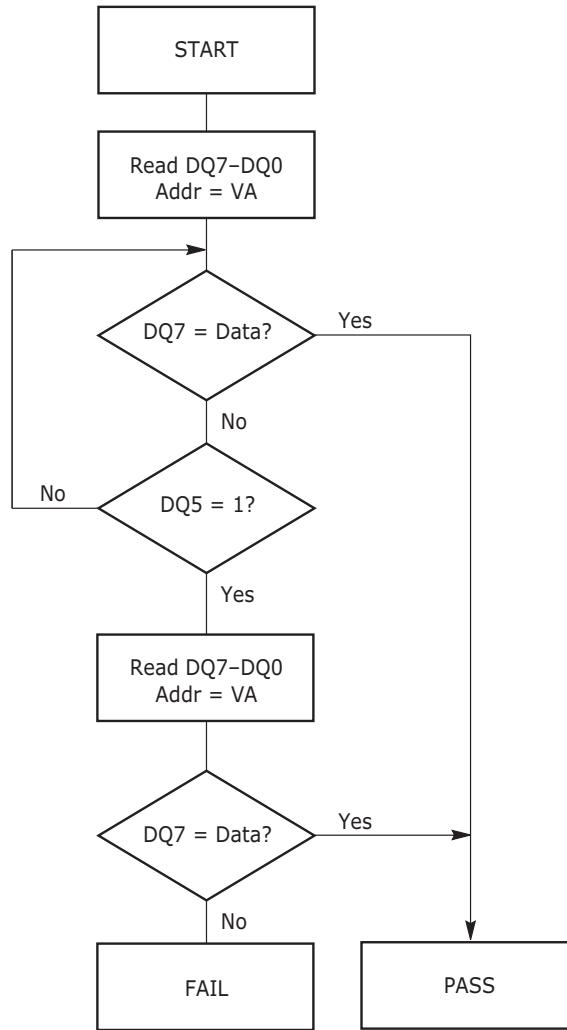

During the Embedded Erase algorithm, Data# Polling produces a "0" on DQ7. When the Embedded Erase algorithm is complete, or if the bank enters the Erase Suspend mode, Data# Polling produces a "1" on DQ7. The system must provide

an address within any of the sectors selected for erasure to read valid status information on DQ7.

After an erase command sequence is written, if all sectors selected for erasing are protected, Data# Polling on DQ7 is active for approximately 100  $\mu$ s, then the bank returns to the read mode. If not all selected sectors are protected, the Embedded Erase algorithm erases the unprotected sectors, and ignores the selected sectors that are protected. However, if the system reads DQ7 at an address within a protected sector, the status may not be valid.

When the system detects DQ7 has changed from the complement to true data, it can read valid data at DQ15–DQ0 (or DQ7–DQ0 for x8-only device) on the *following* read cycles. Just prior to the completion of an Embedded Program or Erase operation, DQ7 may change asynchronously with DQ15–DQ8 (DQ7–DQ0 for x8-only device) while Output Enable (OE#) is asserted low. That is, the device may change from providing status information to valid data on DQ7. Depending on when the system samples the DQ7 output, it may read the status or valid data. Even if the device has completed the program or erase operation and DQ7 has valid data, the data outputs on DQ15–DQ0 may be still invalid. Valid data on DQ15–DQ0 (or DQ7–DQ0 for x8-only device) will appear on successive read cycles.

[Table 12](#) shows the outputs for Data# Polling on DQ7. [6](#) shows the Data# Polling algorithm. [22](#) in the "AC Characteristics" section shows the Data# Polling timing diagram.

**Notes:**

1. VA = Valid address for programming. During a sector erase operation, a valid address is any sector address within the sector being erased. During chip erase, a valid address is any non-protected sector address.
2. DQ7 should be rechecked even if DQ5 = "1" because DQ7 may change simultaneously with DQ5.

**Figure 6. Data# Polling Algorithm**

**RY/BY#: Ready/Busy#**

The RY/BY# is a dedicated, open-drain output pin which indicates whether an Embedded Algorithm is in progress or complete. The RY/BY# status is valid after the rising edge of the final WE# pulse in the command sequence. Since RY/BY# is an open-drain output, several RY/BY# pins can be tied together in parallel with a pull-up resistor to V<sub>CC</sub>.

If the output is low (Busy), the device is actively erasing or programming. (This includes programming in the Erase Suspend mode.) If the output is high (Ready), the device is in the read mode, the standby mode, or one of the banks is in the erase-suspend-read mode.

Table 12 shows the outputs for RY/BY#.

## DQ6: Toggle Bit I

Toggle Bit I on DQ6 indicates whether an Embedded Program or Erase algorithm is in progress or complete, or whether the device has entered the Erase Suspend mode. Toggle Bit I may be read at any address, and is valid after the rising edge of the final WE# pulse in the command sequence (prior to the program or erase operation), and during the sector erase time-out.

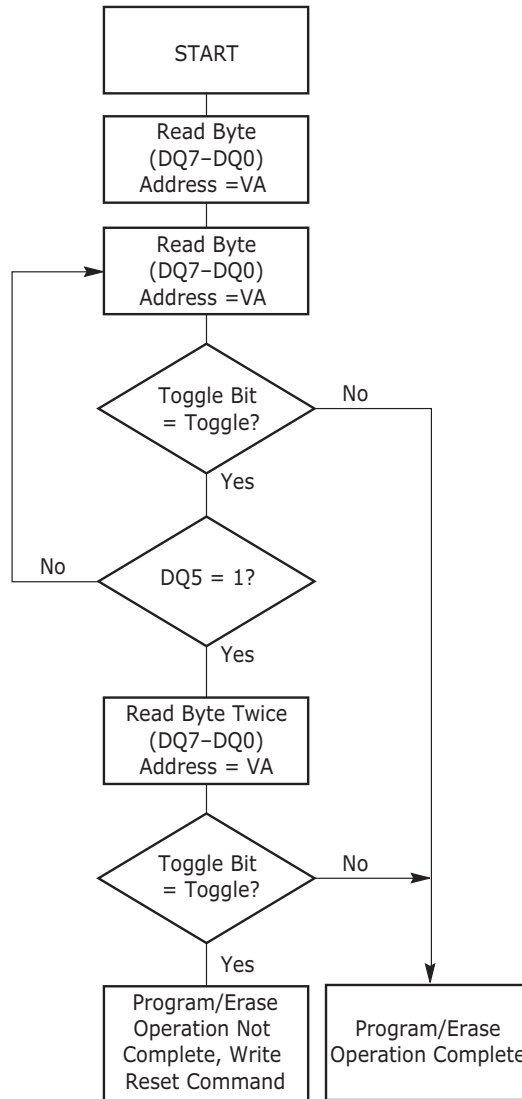

During an Embedded Program or Erase algorithm operation, successive read cycles to any address cause DQ6 to toggle. The system may use either OE# or CE# to control the read cycles. When the operation is complete, DQ6 stops toggling.

After an erase command sequence is written, if all sectors selected for erasing are protected, DQ6 toggles for approximately 100  $\mu$ s, then returns to reading array data. If not all selected sectors are protected, the Embedded Erase algorithm erases the unprotected sectors, and ignores the selected sectors that are protected.

The system can use DQ6 and DQ2 together to determine whether a sector is actively erasing or is erase-suspended. When the device is actively erasing (that is, the Embedded Erase algorithm is in progress), DQ6 toggles. When the device enters the Erase Suspend mode, DQ6 stops toggling. However, the system must also use DQ2 to determine which sectors are erasing or erase-suspended. Alternatively, the system can use DQ7 (see the subsection on "[DQ7: Data# Polling](#)" section).

If a program address falls within a protected sector, DQ6 toggles for approximately 1  $\mu$ s after the program command sequence is written, then returns to reading array data.

DQ6 also toggles during the erase-suspend-program mode, and stops toggling once the Embedded Program algorithm is complete.

**Note:** The system should recheck the toggle bit even if DQ5 = "1" because the toggle bit may stop toggling as DQ5 changes to "1." See the subsections on DQ6 and DQ2 for more information.

**Figure 7. Toggle Bit Algorithm**

### DQ2: Toggle Bit II

The "Toggle Bit II" on DQ2, when used with DQ6, indicates whether a particular sector is actively erasing (that is, the Embedded Erase algorithm is in progress), or whether that sector is erase-suspended. Toggle Bit II is valid after the rising edge of the final WE# pulse in the command sequence.

DQ2 toggles when the system reads at addresses within those sectors that have been selected for erasure. (The system may use either OE# or CE# to control the read cycles.) But DQ2 cannot distinguish whether the sector is actively erasing or is erase-suspended. DQ6, by comparison, indicates whether the device is actively erasing, or is in Erase Suspend, but cannot distinguish which sectors are selected for erasure. Thus, both status bits are required for sector and mode information. Refer to [Table 12](#) to compare outputs for DQ2 and DQ6.

7 shows the toggle bit algorithm in flowchart form, and the section "DQ2: Toggle Bit II" explains the algorithm. See also the "[DQ6: Toggle Bit I](#)" section subsection.

23 shows the toggle bit timing diagram. 24 shows the differences between DQ2 and DQ6 in graphical form.

### Reading Toggle Bits DQ6/DQ2

Refer to 7 for the following discussion. Whenever the system initially begins reading toggle bit status, it must read DQ15–DQ0 (or DQ7–DQ0 for x8-only device) at least twice in a row to determine whether a toggle bit is toggling. Typically, the system would note and store the value of the toggle bit after the first read. After the second read, the system would compare the new value of the toggle bit with the first. If the toggle bit is not toggling, the device has completed the program or erase operation. The system can read array data on DQ15–DQ0 (or DQ7–DQ0 for x8-only device) on the following read cycle.

However, if after the initial two read cycles, the system determines that the toggle bit is still toggling, the system also should note whether the value of DQ5 is high (see the section on DQ5). If it is, the system should then determine again whether the toggle bit is toggling, since the toggle bit may have stopped toggling just as DQ5 went high. If the toggle bit is no longer toggling, the device has successfully completed the program or erase operation. If it is still toggling, the device did not complete the operation successfully, and the system must write the reset command to return to reading array data.

The remaining scenario is that the system initially determines that the toggle bit is toggling and DQ5 has not gone high. The system may continue to monitor the toggle bit and DQ5 through successive read cycles, determining the status as described in the previous paragraph. Alternatively, it may choose to perform other system tasks. In this case, the system must start at the beginning of the algorithm when it returns to determine the status of the operation (top of 7).

### DQ5: Exceeded Timing Limits

DQ5 indicates whether the program or erase time has exceeded a specified internal pulse count limit. Under these conditions DQ5 produces a "1," indicating that the program or erase cycle was not successfully completed.

The device may output a "1" on DQ5 if the system tries to program a "1" to a location that was previously programmed to "0." **Only an erase operation can change a "0" back to a "1."** Under this condition, the device halts the operation, and when the timing limit has been exceeded, DQ5 produces a "1."

Under both these conditions, the system must write the reset command to return to the read mode (or to the erase-suspend-read mode if a bank was previously in the erase-suspend-program mode).

### DQ3: Sector Erase Timer

After writing a sector erase command sequence, the system may read DQ3 to determine whether or not erasure has begun. (The sector erase timer does not apply to the chip erase command.) If additional sectors are selected for erasure, the entire time-out also applies after each additional sector erase command. When the time-out period is complete, DQ3 switches from a "0" to a "1." If the time between additional sector erase commands from the system can be assumed to be less than 50  $\mu$ s, the system need not monitor DQ3. See also the "[Sector Erase Command Sequence](#)" section section.

After the sector erase command is written, the system should read the status of DQ7 (Data# Polling) or DQ6 (Toggle Bit I) to ensure that the device has accepted the command sequence, and then read DQ3. If DQ3 is "1," the Embedded Erase

algorithm has begun; all further commands (except Erase Suspend) are ignored until the erase operation is complete. If DQ3 is "0," the device will accept additional sector erase commands. To ensure the command has been accepted, the system software should check the status of DQ3 prior to and following each subsequent sector erase command. If DQ3 is high on the second status check, the last command might not have been accepted.

Table 12 shows the status of DQ3 relative to the other status bits.

**Table 12. Write Operation Status**

Status		DQ7 (Note 2)	DQ6	DQ5 (Note 1)	DQ3	DQ2 (Note 2)	RY/BY#	
Standard Mode	Embedded Program Algorithm	DQ7#	Toggle	0	N/A	No toggle	0	
	Embedded Erase Algorithm	0	Toggle	0	1	Toggle	0	
Erase Suspend Mode	Erase-Suspend-Read	Erase Suspended Sector	1	No toggle	0	N/A	Toggle	1
		Non-Erase Suspended Sector	Data	Data	Data	Data	Data	1
	Erase-Suspend-Program	DQ7#	Toggle	0	N/A	N/A	0	

**Notes:**

1. DQ5 switches to '1' when an Embedded Program or Embedded Erase operation has exceeded the maximum timing limits. Refer to the section on DQ5 for more information.
2. DQ7 and DQ2 require a valid address when reading status information. Refer to the appropriate subsection for further details.
3. When reading write operation status bits, the system must always provide the bank address where the Embedded Algorithm is in progress. The device outputs array data if the system addresses a non-busy bank.

## Absolute Maximum Ratings

Storage Temperature	
Plastic Packages	-65°C to +150°C
Ambient Temperature with Power Applied	-65°C to +125°C
Voltage with Respect to Ground	
V <sub>CC</sub> (Note 1)	-0.5 V to +4.0 V
OE# and RESET# (Note 2)	-0.5 V to +12.5 V
WP#/ACC	-0.5 V to +10.5 V
All other pins (Note 1)	-0.5 V to V <sub>CC</sub> +0.5 V
Output Short Circuit Current (Note 3)	200 mA

**Notes:**

1. Minimum DC voltage on input or I/O pins is -0.5 V. During voltage transitions, input or I/O pins may overshoot V<sub>SS</sub> to -2.0 V for periods of up to 20 ns. Maximum DC voltage on input or I/O pins is V<sub>CC</sub> +0.5 V. See Figure 8. During voltage transitions, input or I/O pins may overshoot to V<sub>CC</sub> +2.0 V for periods up to 20 ns. See Figure 9.
2. Minimum DC input voltage on pins OE#, RESET#, and WP#/ACC is -0.5 V. During voltage transitions, OE#, WP#/ACC, and RESET# may overshoot V<sub>SS</sub> to -2.0 V for periods of up to 20 ns. See Figure 8. Maximum DC input voltage on WP#/ACC is +9.5 V which may overshoot to +12.0 V for periods up to 20 ns.
3. No more than one output may be shorted to ground at a time. Duration of the short circuit should not be greater than one second.

Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational sections of this data sheet is not implied. Exposure of the device to absolute maximum rating conditions for extended periods may affect device reliability.

Figure 8. Maximum Negative Overshoot Waveform

Figure 9. Maximum Positive Overshoot Waveform

## OPERATING RANGES

**Wireless (W) Devices**

Ambient Temperature (T<sub>A</sub>) . . . . . -25°C to +85°C

**Industrial (I) Devices**

Ambient Temperature (T<sub>A</sub>) . . . . . -40°C to +85°C

**V<sub>CC</sub> Supply Voltages**

V<sub>CC</sub> for standard voltage range . . . . . 2.7 V to 3.6 V

Operating ranges define those limits between which the functionality of the device is guaranteed.

## DC Characteristics

Table 13. CMOS Compatible

Parameter Symbol	Parameter Description	Test Conditions	Min	Typ	Max	Unit
$I_{LI}$	Input Load Current	$V_{IN} = V_{SS}$ to $V_{CC}$ , $V_{CC} = V_{CC\ max}$			$\pm 1.0$	$\mu A$

$I_{CC5}$	Automatic Sleep Mode (Notes 2, 4)	$V_{IH} = V_{CC} \pm 0.3$ V; $V_{IL} = V_{SS} \pm 0.3$ V		0.2	5	$\mu A$
$I_{CC6}$	$V_{CC}$ Active Read-While-Program Current (Notes 1, 2)	CE# = $V_{IL}$ , OE# = $V_{IH}$	Byte	21	45	mA
			Word	21	45	
$I_{CC7}$	$V_{CC}$ Active Read-While-Erase Current (Notes 1, 2)	CE# = $V_{IL}$ , OE# = $V_{IH}$	Byte	21	45	mA
			Word	21	45	
$I_{CC8}$	$V_{CC}$ Active Program-While-Erase-Suspended Current (Notes 2, 5)	CE# = $V_{IL}$ , OE# = $V_{IH}$		17	35	mA
$V_{IL}$	Input Low Voltage		-0.5		0.8	V
$V_{IH}$	Input High Voltage		$0.7 \times V_{CC}$		$V_{CC} + 0.3$	V
$V_{HH}$	Voltage for WP#/ACC Sector Protect/Unprotect and Program Acceleration	$V_{CC} = 3.0$ V $\pm$ 10%	8.5		9.5	V
$V_{ID}$	Voltage for Autoselect and Temporary Sector Unprotect	$V_{CC} = 3.0$ V $\pm$ 10%	11.5		12.5	V
$V_{OL}$	Output Low Voltage	$I_{OL} = 2.0$ mA, $V_{CC} = V_{CC\ min}$			0.45	V
$V_{OH1}$	Output High Voltage	$I_{OH} = -2.0$ mA, $V_{CC} = V_{CC\ min}$	$0.85 V_{CC}$			V
$V_{OH2}$		$I_{OH} = -100$ $\mu A$ , $V_{CC} = V_{CC\ min}$	$V_{CC} - 0.4$			
$V_{LKO}$	Low $V_{CC}$ Lock-Out Voltage (Note 5)		2.3		2.5	V

**Notes:**

1. The  $I_{CC}$  current listed is typically less than 2 mA/MHz, with OE# at  $V_{IH}$ .
2. Maximum  $I_{CC}$  specifications are tested with  $V_{CC} = V_{CC\ max}$ .
3.  $I_{CC}$  active while Embedded Erase or Embedded Program is in progress.
4. Automatic sleep mode enables the low power mode when addresses remain stable for  $t_{ACC} + 30$  ns. Typical sleep mode current is 200 nA.
5. Not 100% tested.

### Zero-Power Flash

**Note:** Addresses are switching at 1 MHz

**Figure 10.  $I_{CCI}$  Current vs. Time (Showing Active and Automatic Sleep Currents)**

**Note:**  $T = 25 \times C$

**Figure 11. Typical  $I_{CCI}$  vs. Frequency**

### Test Conditions

**Note:** Diodes are IN3064 or equivalent

**Figure 12. Test Setup**

**Table 14. Test Specifications**

Test Condition	All Speeds	Unit
Output Load	1 TTL gate	
Output Load Capacitance, $C_L$ (including jig capacitance)	30	pF
Input Rise and Fall Times	5	ns
Input Pulse Levels	0.0–3.0	V
Input timing measurement reference levels	1.5	V
Output timing measurement reference levels	1.5	V

### Switching Waveforms

## Erase And Programming Performance

Parameter	Typ (Note 1)	Max (Note 2)	Unit	Comments
Sector Erase Time	0.4	5	sec	Excludes 00h programming prior to erasure (Note 4)
Chip Erase Time	56		sec	
Word Program Time	7	210	μs	Excludes system level overhead (Note 5)
Accelerated Byte/Word Program Time	4	120	μs	
Accelerated Chip Programming Time	10	30	sec	
Byte Program Time	5	150	μs	
Chip Program Time (Note 3)	Byte Mode	42	sec	
	Word Mode	28		

### Notes:

1. Typical program and erase times assume the following conditions: 25°C, 3.0 V  $V_{CC}$ , 100,000 cycles; checkerboard data pattern.
2. Under worst case conditions of 90°C,  $V_{CC} = 2.7$  V, 1,000,000 cycles.
3. The typical chip programming time is considerably less than the maximum chip programming time listed, since most bytes program faster than the maximum program times listed.
4. In the pre-programming step of the Embedded Erase algorithm, all bytes are programmed to 00h before erasure.
5. System-level overhead is the time required to execute the two- or four-bus-cycle sequence for the program command. See [Table 11](#) for further information on command definitions.
6. The device has a minimum cycling endurance of 100,000 cycles per sector.
7. Contact the local sales office for minimum cycling endurance values in specific applications and operating conditions.

## Latchup Characteristics

Description	Min	Max
Input voltage with respect to $V_{SS}$ on all pins except I/O pins (including OE# and RESET#)	-1.0 V	12.5 V
Input voltage with respect to $V_{SS}$ on all I/O pins	-1.0 V	$V_{CC} + 1.0$ V
$V_{CC}$ Current	-100 mA	+100 mA

**Note:** Includes all pins except  $V_{CC}$ . Test conditions:  $V_{CC} = 3.0$  V, one pin at a time.

# 16 Mb SRAM (supplier I)

## 16 Megabit (1Mb x 16 bit) CMOS SRAM

### Functional Description

CE#	CS2	OE#	WE#	LB#	UB#	IO <sub>0-7</sub>	IO <sub>8-15</sub>	Mode	Power
H	X	X	X	X	X	High-Z	High-Z	Deselected	Standby
X	L	X	X	X	X	High-Z	High-Z	Deselected	Standby
X	X	X	X	H	H	High-Z	High-Z	Deselected	Standby
L	H	H	H	L	X	High-Z	High-Z	Output Disabled	Active
L	H	H	H	X	L	High-Z	High-Z	Output Disabled	Active
L	H	L	H	L	H	D <sub>out</sub>	High-Z	Lower Byte Read	Active
L	H	L	H	H	L	High-Z	D <sub>out</sub>	Upper Byte Read	Active
L	H	L	H	L	L	D <sub>out</sub>	D <sub>out</sub>	Word Read	Active
L	H	X	L	L	H	D <sub>in</sub>	High-Z	Lower Byte Write	Active
L	H	X	L	H	L	High-Z	D <sub>in</sub>	Upper Byte Write	Active
L	H	X	L	L	L	D <sub>in</sub>	D <sub>in</sub>	Word Write	Active

**Note:** X means don't care (must be low or high state).

### Absolute Maximum Ratings

Item	Symbol	Ratings	Unit
Voltage on any pin relative to V <sub>SS</sub>	V <sub>IN</sub> , V <sub>OUT</sub>	-0.2 to V <sub>CC</sub> +0.3V (Max. 3.6V)	V
Voltage on V <sub>CC</sub> supply relative to V <sub>SS</sub>	V <sub>CC</sub>	-0.2 to 3.6V	V
Power Dissipation	P <sub>D</sub>	1.0	W
Storage Temperature	T <sub>STG</sub>	-85 to 150	°C
Operating Temperature	T <sub>A</sub>	-40 to 85	°C

Stresses greater than those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. Functional operation should be restricted to recommended operating condition. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

## DC Characteristics

### Recommended DC Operating Conditions (Note 1)

Item	Symbol	Min	Typ	Max	Unit
Supply voltage	$V_{CC}$	2.7	3.0	3.3	V
Ground	$V_{SS}$	0	0	0	V
Input high voltage	$V_{IH}$	2.2	-	$V_{CC}+0.2$ (Note 2)	V
Input low voltage	$V_{IL}$	-0.2 (Note 3)	-	0.6	V

**Notes:**

1.  $T_A = -40$  to  $85^\circ\text{C}$ , otherwise specified.
2. Overshoot:  $V_{CC}+2.0\text{V}$  in case of pulse width  $\leq 20\text{ns}$ .
3. Undershoot:  $-2.0\text{V}$  in case of pulse width  $\leq 20\text{ns}$ .
4. Overshoot and undershoot are sampled, not 100% tested.

### Capacitance (f=1MHz, $T_A=25^\circ\text{C}$ )

Item	Symbol	Test Condition	Min	Max	Unit
Input capacitance	$C_{IN}$	$V_{IN}=0\text{V}$	-	8	pF
Input/Output capacitance	$C_{IO}$	$V_{IO}=0\text{V}$	-	10	pF

**Note:** Capacitance is sampled, not 100% tested

### DC Operating Characteristics

Item	Symbol	Test Conditions	Min	Typ (Note)	Max	Unit
Input leakage current	$I_{LI}$	$V_{IN}=V_{SS}$ to $V_{CC}$	-1	-	1	$\mu\text{A}$
Output leakage current	$I_{LO}$	$CE1\#=V_{IH}$ , $CS2=V_{IL}$ or $OE\#=V_{IH}$ or $WE\#=V_{IL}$ or $LB\#=UB\#=V_{IH}$ , $V_{IO}=V_{SS}$ to $V_{CC}$	-1	-	1	$\mu\text{A}$
Average operating current	$I_{CC1}$	Cycle time= $1\mu\text{s}$ , 100% duty, $I_{IO}=0\text{mA}$ , $CE1\#\leq 0.2\text{V}$ , $LB\#\leq 0.2\text{V}$ and/or $UB\#\leq 0.2\text{V}$ , $CS2\geq V_{CC}-0.2\text{V}$ , $V_{IN}\leq 0.2\text{V}$ or $V_{IN}\geq V_{CC}-0.2\text{V}$	-	-	5	$\mu\text{A}$
	$I_{CC2}$	Cycle time=Min, $I_{IO}=0\text{mA}$ , 100% duty, $CE1\#=V_{IL}$ , $CS2=V_{IH}$ , $LB\#=V_{IL}$ and/or $UB\#=V_{IL}$ , $V_{IN}=V_{IL}$ or $V_{IH}$	70ns	-	30	mA
Output low voltage	$V_{OL}$	$I_{OL} = 2.1\text{mA}$	-	-	0.4	V
Output high voltage	$V_{OH}$	$I_{OH} = -1.0\text{mA}$	2.4	-	-	V
Standby Current (CMOS)	$I_{SB1}$	Other input = $0-V_{CC}$ 1. $CE1\#\geq V_{CC}-0.2\text{V}$ , $CS2\geq V_{CC}-0.2\text{V}$ ( $CE1\#$ controlled) or 2. $0\text{V}\geq CS2\leq 0.2\text{V}$ ( $CS2$ controlled)	-	-5.0	25	$\mu\text{A}$

**Note:** Typical values are measured at  $V_{CC}=2.0\text{V}$ ,  $T_A=25^\circ\text{C}$  and not 100% tested.

## AC Characteristics

### Read/Write Characteristics ( $V_{CC}=2.7-3.3V$ )

	Parameter List	Symbol	Min	Max	Units
Read	Read cycle time	$t_{RC}$	70	-	ns
	Address access time	$t_{AA}$	-	70	ns
	Chip select to output	$t_{CO1}, t_{CO2}$	-	70	ns
	Output enable to valid output	$t_{OE}$	-	35	ns
	LB#, UB# valid to data output	$t_{BA}$	-	70	ns
	Chip select to low-Z output	$t_{LZ1}, t_{LZ2}$	10	-	ns
	Output enable to low-Z output	$t_{OLZ}$	5	-	ns
	LB#, UB# enable to low-Z output	$t_{BLZ}$	10	-	ns
	Output hold from address change	$t_{OH}$	10	-	ns
	Chip disable to high-Z output	$t_{HZ1}, t_{HZ2}$	0	25	ns
	OE# disable to high-Z output	$t_{OHZ}$	0	25	ns
	UB#, LB# disable to high-Z output	$t_{BHZ}$	0	25	ns
	Write	Write cycle time	$t_{WC}$	70	-
Chip select to end of write		$t_{CW1}, t_{CW2}$	60	-	ns
Address set-up time		$t_{AS}$	0	-	ns
Address valid to end of write		$t_{AW}$	60	-	ns
Write pulse width		$t_{WP}$	50	-	ns
Write recovery time		$t_{WR}$	0	-	ns
Write to output high-Z		$t_{WHZ}$	0	20	ns
Data to write time overlap		$t_{DW}$	30	-	ns
Data hold from write time		$t_{DH}$	0	-	ns
End write to output low-Z		$t_{OW}$	5	-	ns
LB#, UB# valid to end of write		$t_{BW}$	60	-	ns

### Data Retention Characteristics

Item	Symbol	Test Condition	Min	Typ	Max	Unit
$V_{CC}$ for data retention	$V_{DR}$	$CE1\#\geq V_{CC}-0.2V$ (Note 1), $V_{IN}\geq 0V$	1.5	-	3.3	V
Data retention current	$I_{DR}$	$V_{CC}=1.5V$ , $CE1\#\geq V-0.2V$ (Note 1), $V_{IN}\geq 0V$	-	1.0 (Note 2)	15	$\mu A$
Data retention set-up time	$t_{SDR}$	See data retention waveform	0	-	-	ns
Recovery time	$t_{RDR}$		$t_{RC}$	-	-	

#### Notes:

- $CE1\#\leq V_{CC}-0.2$ ,  $CS2\leq V_{CC}-0.2V$  ( $CE1\#$  controlled) or  $0\leq CS2-0.2V$  ( $CS2$  controlled)
- Typical values are measured at  $T_A=26^\circ C$  and not 100% tested.

Timing Diagrams

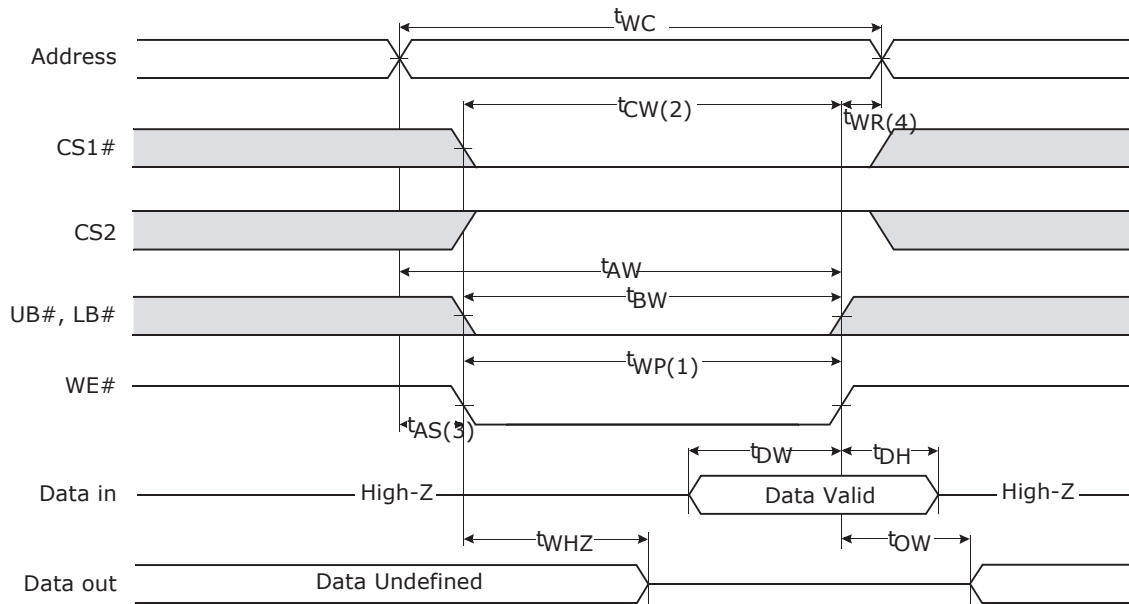

Figure 28. Timing Waveform of Read Cycle(1) (address controlled,  $CD\#I=OE\#=V_{IL}$ ,  $CS2=WE\#=V_{IH}$ ,  $UB\#$  and/or  $LB\#=V_{IL}$ )

Notes:

1.  $t_{HZ}$  and  $t_{OHZ}$  are defined as the time at which the outputs achieve the open circuit conditions and are not referenced to output voltage levels.
2. At any given temperature and voltage condition,  $t_{HZ}(Max.)$  is less than  $t_{LZ}(Min.)$  both for a given device and from device to device interconnection.

Figure 29. Timing Waveform of Read Cycle(2) ( $WE\#=V_{IH}$ )

**Figure 30. Timing Waveform of Write Cycle(1) (WE# controlled)**

**Figure 31. Timing Waveform of Write Cycle(2) (CS# controlled)**

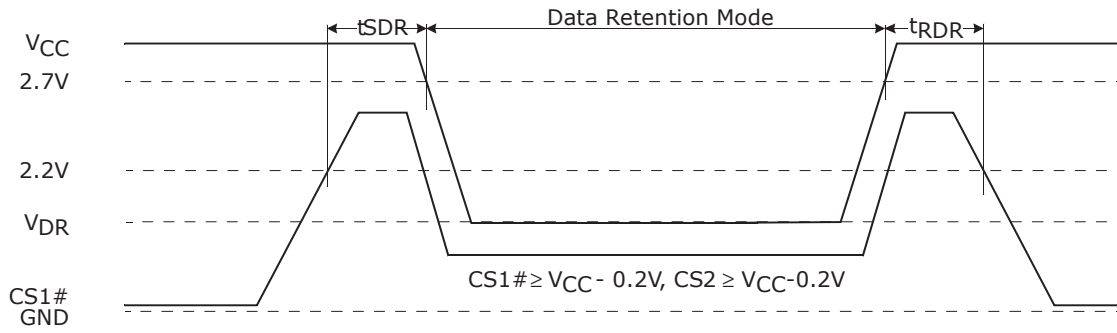

**Notes:**

1. A write occurs during the overlap ( $t_{WP}$ ) of low CS1# and low WE#. A write begins when CS1# goes low and WE# goes low with asserting UB# or LB# for single byte operation or simultaneously asserting UB# and LB# for double byte operation. A write ends at the earliest transition when CS1# goes high and WE# goes high. The  $t_{WP}$  is measured from the beginning of write to the end of write.
2.  $t_{CW}$  is measured from the CS1# going low to the end of write.
3.  $t_{AS}$  is measured from the address valid to the beginning of write.
4.  $t_{WR}$  is measured from the end of write to the address change.  $t_{WR}$  applied in case a write ends as CS1# or WE# going high.

# 8 Mb pSRAM (supplier 2)

## 8 Megabit (512 K x 16 bit) Ultra-low Power Asynchronous CMOS Pseudo SRAM

### Features

- Single Wide Power Supply Range
  - 2.7 to 3.6 Volts
- Very low standby current
  - 65µA at 3.0V (Max)
- Simple memory control
  - Dual Chip Enables (CE1# and CE2)
  - Byte control for independent byte operation
  - Output Enable (OE#) for memory expansion
- Very fast output enable access time
  - 35ns OE# access time
- Automatic power down to standby mode
- TTL compatible three-state output driver
- Operating Temperature
  - -40°C to +85°C
- Power Supply
  - 2.3V - 3.6V
- Speed
  - 70ns @ 2.7V

### General Description

The S71JL064H80—10/11/12 contains an integrated memory device containing a low power 8 Mbit SRAM built using a self-refresh DRAM array organized as 512,288 words by 16 bits. It is designed to be identical in operation and interface to standard 6T SRAMS. The device is designed for low standby and operating current and includes a power-down feature to automatically enter standby mode. The device operates with two chip enable (CE1# and CE2) controls and output enable (OE#) to allow for easy memory expansion. Byte controls (UB# and LB#) allow the upper and lower bytes to be accessed independently and can also be used to deselect the device. The S71JL064H80 is optimal for various applications where low-power is critical such as battery backup and hand-held devices. The device can operate over a very wide temperature range of -40°C to +85°C and is available in tested wafer format.

## Block Diagram

Figure 4I. Functional Block Diagram

Table 18. Functional Description

CE1#	CE2	WE#	OE#	UB#	LB#	I/O <sub>0</sub> - I/O <sub>15</sub> (Note 1)	MODE	POWER
H	X	X	X	X	X	High Z	Standby (Note 2)	Standby
X	L	X	X	X	X	High Z	Standby (Note 2)	Standby
L	H	X	X	H	H	High Z	Standby	Standby
L	H	L	X (Note 3)	L (Note 1)	L (Note 1)	Data In	Write	Active
L	H	H	L	L (Note 1)	L (Note 1)	Data Out	Read	Active
L	H	H	H	L (Note 1)	L (Note 1)	High Z	Active	Active

**Notes:**

- When UB# and LB# are in select mode (low), I/O<sub>0</sub> - I/O<sub>15</sub> are affected as shown. When LB# only is in the select mode only I/O<sub>0</sub> - I/O<sub>7</sub> are affected as shown. When UB# is in the select mode only I/O<sub>8</sub> - I/O<sub>15</sub> are affected as shown.
- When the device is in standby mode, control inputs (WE#, OE#, UB#, and LB#), address inputs and data input/outputs are internally isolated from any external influence and disabled from exerting any influence externally.
- When WE# is invoked, the OE# input is internally disabled and has no effect on the circuit.

## Absolute Maximum Ratings (See Note)

Item	Symbol	Rating	Unit
Voltage on any pin relative to V <sub>SS</sub>	V <sub>IN,OUT</sub>	-0.3 to V <sub>CC</sub> +0.3	V
Voltage on V <sub>CC</sub> Supply Relative to V <sub>SS</sub>	V <sub>CC</sub>	-0.3 to 4.5	V
Operating Temperature	T <sub>A</sub>	-40 to +85	°C

**Note:** Stresses greater than those listed above may cause permanent damage to the device. This is a stress rating only, and functional operation of the device at these or any other conditions above those indicated in the operating section of

this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

## DC Characteristics

### Operating Characteristics (Over Specified Temperature Range)

Item	Symbol	Test Conditions	Min	Typ. (Note 1)	Max.	Unit
Supply Voltage	$V_{CC}$		2.7	3.0	3.6	V
Input High Voltage	$V_{IH}$		2.2		$V_{CC}+0.3$	V
Input Low Voltage	$V_{IL}$		-0.3		0.6	V
Output High Voltage	$V_{OH}$	$I_{OH} = -1.0\text{mA}$	$V_{CC}-0.4$			V
Output Low Voltage	$V_{OL}$	$I_{OL} = 2.0\text{mA}$			0.4	V
Input Leakage Current	$I_{LI}$	$V_{IN} = 0$ to $V_{CC}$			0.5	$\mu\text{A}$
Output Leakage Current	$I_{LO}$	OE# = $V_{IH}$ or Chip Disabled			0.5	$\mu\text{A}$
Read/Write Operating Supply Current @ 1 $\mu\text{s}$ Cycle Time (Note 2)	$I_{CC1}$	$V_{CC}=3.6\text{ V}$ , $V_{IN}=V_{IH}$ or $V_{IL}$ Chip Enabled, $I_{OUT} = 0$		3.0	5.0	mA
	$I_{CC2}$	$V_{CC}=3.3\text{ V}$ , $V_{IN}=V_{IH}$ or $V_{IL}$ Chip Enabled, $I_{OUT} = 0$			5.0	
Read/Write Operating Supply Current @ 70ns Cycle Time (Note 2)	$I_{CC3}$	$V_{CC}=3.6\text{ V}$ , $V_{IN}=V_{IH}$ or $V_{IL}$ Chip Enabled, $I_{OUT} = 0$		12.0	25.0	mA
	$I_{CC4}$	$V_{CC}=3.3\text{ V}$ , $V_{IN}=V_{IH}$ or $V_{IL}$ Chip Enabled, $I_{OUT} = 0$			23.0	
Maximum Standby Current (Standard Part)	$I_{SB1}$	$V_{IN} = V_{CC}$ or 0V Chip Disabled $t_A = 85^\circ\text{C}$ , $V_{CC} = 3.0\text{ V}$			70.0	$\mu\text{A}$
Maximum Standby Current (Ultra Low Power Part)	$I_{SB1}$	$V_{IN} = V_{CC}$ or 0V Chip Disabled $t_A = 85^\circ\text{C}$ , $V_{CC} = 3.0\text{ V}$			60.0	$\mu\text{A}$

#### Notes:

- Typical values are measured at  $V_{CC}=V_{CC}$  Typ.,  $T_A=25^\circ\text{C}$ , and not 100% tested.
- This parameter is specified with the outputs disabled to avoid external loading effects. The user must add current required to drive output capacitance expected in the actual system.

## AC Characteristics

#### General Description

The S71JL064HA0-10/11/12 contains an integrated memory device containing a low-power, 16 Mbit SRAM built using a self-refresh DRAM array organized as 1,024,576 words by 16 bits. It is designed to be identical in operation and interface to standard 6T SRAMS. The device is designed for low standby and operating current and includes a power-down feature to automatically enter standby mode. The device operates with two chip enable (CE1# and CE2) controls and output enable (OE#) to allow for easy memory expansion. Byte controls (UB# and LB#) allow the upper and lower bytes to be accessed independently and can also be used to deselect the device. The S71JL064HA0 is optimal for various applications where low-power is critical, such as battery backup and hand-held devices. The device can operate over a very wide temperature range of -40°C to +85°C and is available in tested wafer format.

## Block Diagram

Figure 46. Functional Block Diagram

Table 21. Functional Description

CE1#	CE2	WE#	OE#	UB#/LB#	I/O (Note 1)	MODE	POWER
H	X	X	X	X	High Z	Standby (Note 2)	Standby
X	L	X	X	X	High Z	Standby (Note 4)	Standby
L	H	X	X	H	High Z	Standby (Note 4)	Standby
L	H	L	X	L (Note 3)	Data In	Write (Note 3)	Active -> Standby (Note 4)
L	H	H	L	L (Note 3)	Data Out	Read	Active -> Standby (Note 4)
L	H	H	H	L (Note 3)	High Z	Active	Standby (Note 4)

**Notes:**

1. When UB# and LB# are in select mode (low), I/O<sub>0</sub> - I/O<sub>15</sub> are affected as shown. When LB# only is in the select mode only I/O<sub>0</sub> - I/O<sub>7</sub> are affected as shown. When UB is in the select mode only I/O<sub>8</sub> - I/O<sub>15</sub> are affected as shown. If both UB# and LB# are in the deselect mode (high), the chip is in a standby mode regardless of the state of CE1# or CE2.#
2. When the device is in standby mode, control inputs (WE#, OE#, UB#, and LB), address inputs and data input/outputs are internally isolated from any external influence and disabled from exerting any influence externally.
3. When WE# is invoked, the OE# input is internally disabled and has no effect on the circuit.
4. The device will consume active power in this mode whenever addresses are changed. Data inputs are internally isolated from any external influence.

## Absolute Maximum Ratings (See Note)

Item	Symbol	Rating	Unit
Voltage on any pin relative to $V_{SS}$	$V_{IN,OUT}$	-0.3 to $V_{CC}+0.3$	V
Voltage on $V_{CC}$ Supply Relative to $V_{SS}$	$V_{CC}$	-0.3 to 4.0	V
Power Dissipation	$P_D$	500	mW
Storage Temperature	$T_{STG}$	-40 to 125	°C
Operating Temperature	$T_A$	-40 to +85	°C

**Note:** Stresses greater than those listed above may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operating section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

## DC Characteristics

### Operating Characteristics (Over Specified Temperature Range)

Item	Symbol	Comments	Min	Typ. (Note 1)	Max.	Unit
Supply Voltage	$V_{CC}$		2.7	3.0	3.6	V
Input High Voltage	$V_{IH}$		2.2		$V_{CC}+0.3$	V

## I6 Megabit (1M x 16) CMOS Pseudo SRAM

### Features

- Organized as 1M words by 16 bits
- Fast Cycle Time : 70 ns
- Standby Current : 100  $\mu$ A
- Deep power-down Current : 10  $\mu$ A (Memory cell data invalid)
- Byte data control: LB# (DQ0 - 7), UB# (DQ8 - 15)
- Compatible with low-power SRAM
- Single Power Supply Voltage : 3.0V $\pm$ 0.3V

### Description

The S71JL064HA0 Model #62 contains a 16M-bit Pseudo SRAM organized as 1M words by 16 bits. It is designed with advanced CMOS technology specified RAM featuring low-power static RAM-compatible function and pin configuration. This device operates from a single power supply. Advanced circuit technology provides both high speed and low power. It is automatically placed in low-power mode when CS1# or both UB# and LB# are asserted high or CS2 is asserted low. There are three control inputs. CS1# and CS2 are used to select the device, and output enable (OE#) provides fast memory access. Data byte control pins (LB#,UB#) provide lower and upper byte access. This device is well suited to various micro-processor system applications where high speed, low power and battery backup are required.

### Pin Description

A0 – A19	=	Address Inputs
DQ0 – DQ15	=	Data Inputs/Outputs
CE1#	=	Chip Enable
CE2	=	Deep Power Down
OE#	=	Output Enable
WE#	=	Write Control
LB#	=	Lower Byte Control
UB#	=	Upper Byte Control
VCC	=	Power Supply
VSS	=	Ground

## Operation Mode

MODE	CE1#	CE2	OE#	WE#	LB#	UB#	DQ0 to DQ7	DQ8 to DQ15	POWER
Deselect	H	H	X	X	X	X	High-Z	High-Z	Standby
Deselect	X	L	X	X	X	X	High-Z	High-Z	Deep Power Down
Deselect	L	H	X	X	H	H	High-Z	High-Z	Standby
Output Disabled	L	H	H	H	L	X	High-Z	High-Z	Active
Output Disabled	L	H	H	H	X	L	High-Z	High-Z	Active
Lower Byte Read	L	H	L	H	L	H	D-out	High-Z	Active
Upper Byte Read	L	H	L	H	H	L	High-Z	D-out	Active
Word Read	L	H	L	H	L	L	D-out	D-out	Active
Lower Byte Write	L	H	X	L	L	H	D-in	High-Z	Active
Upper Byte Write	L	H	X	L	H	L	High-Z	D-in	Active
Word Write	L	H	X	L	L	L	D-in	D-in	Active

**Note:** X=don't care. H=logic high. L=logic low.

## Absolute Maximum Ratings (see Note)

SYMBOL	RATING	VALUE	UNIT
$V_{CC}$	Supply Voltage	-0.2 to +3.6	V
$V_{IN}$	Input Voltages	-0.2 to $V_{CC} + 0.3$	V
$V_{IN}, V_{OUT}$	Output and output Voltages	-2.0 to +3.6	V
$I_{SH}$	Output short circuit current	100	mA
$P_D$	Power Dissipation	1	W

**Note:** Absolute maximum DC requirements contains stress ratings only. Functional operation at the absolute maximum limits is not implied or guaranteed. Extended exposure to maximum ratings may affect device reliability.

## DC Characteristics

Table I6. DC Recommended Operating Conditions

SYMBOL	PARAMETER	MIN	TYP.	MAX	UNIT
$V_{DD}$	Power Supply Voltage	2.7	3.0	3.3	V
$V_{SS}$	Ground	0	-	0	
$V_{IH}$	Input High Voltage	2.2	-	$V_{CC} + 0.2$ (Note 1)	
$V_{IL}$	Input Low Voltage	-0.2 (Note 2)	-	+0.6	

**Notes:**

1. Overshoot:  $V_{CC} + 2.0V$  in case of pulse width  $\leq 20ns$
2. Undershoot:  $-2.0V$  in case of pulse width  $\leq 20ns$
3. Overshoot and undershoot are sampled, not 100% tested.

**Table 17. DC Characteristics ( $T_A = -25^{\circ}\text{C}$  to  $85^{\circ}\text{C}$ ,  $V_{DD} = 2.6$  to  $3.3\text{V}$ )**

SYMBOL	PARAMETER	TEST CONDITION	MIN	MAX	UNIT
$I_{IL}$	Input Leakage Current	$V_{IN} = V_{SS}$ to $V_{DD}$	-1	1	$\mu\text{A}$
$I_{LO}$	Output Leakage Current	$V_{IO} = V_{SS}$ to $V_{DD}$ CE1# = $V_{IH}$ , CE2 = $V_{IL}$ or OE# = $V_{IH}$ or WE# = $V_{IL}$	-1	1	$\mu\text{A}$
$I_{CC1}$	Operating Current @ Min Cycle Time	Cycle time = Min., 100% duty, $I_{IO} = 0\text{mA}$ , CE1# = $V_{IL}$ , CE2 = $V_{IH}$ , $V_{IN} = V_{IH}$ or $V_{IL}$	-	35	$\text{mA}$
$I_{CC2}$	Operating Current @ Max Cycle Time	Cycle time = $1\mu\text{s}$ , 100% duty $I_{IO} = 0\text{mA}$ , CE1# $\leq 0.2\text{V}$ , CE2 $\geq V_{DD} - 0.2\text{V}$ , $V_{IN} \leq 0.2\text{V}$ or $V_{IN} \geq V_{DD} - 0.2\text{V}$	-	5	$\text{mA}$
$I_{SB1}$	Standby Current (CMOS)	CE1# = $V_{DD} - 0.2\text{V}$ and CE2 = $V_{DD} - 0.2\text{V}$ , Other inputs = $V_{SS} \sim V_{CC}$	-	100	$\mu\text{A}$
$I_{SBD}$	Deep Power-down	CE2 $\leq 0.2\text{V}$ , Other inputs = $V_{SS} \sim V_{CC}$	-	10	$\mu\text{A}$
$V_{OL}$	Output Low Voltage	$I_{OL} = 2.1\text{mA}$	-	0.4	V
$V_{OH}$	Output High Voltage	$I_{OH} = -1.0\text{mA}$	2.4	-	V

## AC Characteristics

**Table 18. AC Characteristics and Operating Conditions ( $T_A = -25^{\circ}\text{C}$  to  $85^{\circ}\text{C}$ ,  $V_{DD} = 2.6$  to  $3.3\text{V}$ )**

### Features

- Organized as 2,097,152 words by 16 bits
- Single power supply voltage of 2.6 to 3.3 V
- Direct TTL compatibility for all inputs and outputs
- Deep power-down mode: Memory cell data invalid
- Page operation mode:
  - Page read operation by 8 words
- Logic compatible with SRAM R/W (WE#) pin
- Standby current
  - Standby 70  $\mu$ A
  - Deep power-down standby 5  $\mu$ A
- Access Times:
  - Access Time 70 ns
  - CE1# Access Time 70 ns
  - OE# Access Time 25 ns
  - Page Access Time 30 ns

### Description

The S71JL128HB0 contains a 33,554,432-bit, pseudo static random access memory (PSRAM) organized as 2,097,152 words by 16 bits. It provides high density, high speed, and low power. The device operates single power supply. The device also features SRAM-like W/R timing whereby the device is controlled by DE1#, OE#, and WE# on asynchronous. The device has the page access operation. Page size is 8 words. The device also supports deep power-down mode, realizing low-power standby.

### Pin Description

A0 to A20	=	Address Inputs
A0 to A2	=	Page Address Inputs

Standby	H	H	X	X	X	X	X	High-Z	High-Z	I <sub>DDS</sub>
Deep Power-down Standby	H	L	X	X	X	X	X	High-Z	High-Z	I <sub>DDSD</sub>

**Note:** L = Low-level Input ( $V_{IL}$ ), H = High-level Input ( $V_{IH}$ ), X =  $V_{IH}$  or  $V_{IL}$ , High-Z = High impedance

## Absolute Maximum Ratings

SYMBOL	RATING	VALUE	UNIT
$V_{DD}$	Power Supply Voltage	-1.0 to 3.6	V
$V_{IN}$	Input Voltage	-1.0 to 3.6	V
$V_{OUT}$	Output Voltage	-1.0 to 3.6	V
$T_{opr.}$	Operating Temperature	-40 to 85	°C
$T_{strg.}$	Storage Temperature	-55 to 150	°C
$P_D$	Power Dissipation	0.6	W
$I_{OUT}$	Short Circuit Output Current	50	mA

**Note:** (Stresses greater than listed under "Absolute Maximum Ratings" may cause permanent damage to the device)

## DC Characteristics

**Table 2I. DC Recommended Operating Conditions ( $T_A = -40^{\circ}\text{C}$  to  $85^{\circ}\text{C}$ )**

SYMBOL	PARAMETER	MIN	TYP.	MAX	UNIT
$V_{DD}$	Power Supply Voltage	2.6	2.75	3.3	V
$V_{IH}$	Input High Voltage	2.0	-	$V_{DD} + 0.3$ (Note)	
$V_{IL}$	Input Low Voltage	-0.3 (Note)	-	0.4	

**Note:**  $V_{IL}(\text{Min})$  -1.0 V with 10 ns pulse width;  $V_{IH}(\text{Max})$   $V_{DD}+1.0$  V with 10 ns pulse width

**Table 22. DC Characteristics ( $T_A = -40^\circ\text{C}$  to  $85^\circ\text{C}$ ,  $V_{DD} = 2.6$  to  $3.3\text{V}$ )**

SYMBOL	PARAMETER	TEST CONDITION	MIN	TYP.	MAX	UNIT
$I_{IL}$	Input Leakage Current	$V_{IN} = 0\text{ V to }V_{DD}$	-1.0	-	+1.0	$\mu\text{A}$
$I_{LO}$	Output Leakage Current	Output disable, $V_{OUT} = 0\text{ V to }V_{DD}$	-1.0	-	+1.0	$\mu\text{A}$
$V_{OH}$	Output High Voltage	$I_{OH} = -0.5\text{ mA}$	2.4	-	-	V
$V_{OL}$	Output Low Voltage	$I_{OL} = 1.0\text{ mA}$	-	-	0.4	V
$I_{DDO1}$	Operating Current	CE1# = $V_{IL}$ CE2 = $V_{IH}$ , $I_{OUT} = 0\text{ mA}$ $t_{RC} = \text{min}$	-	-	40	mA
$I_{DDO2}$	Page Access Operating Current	CE1# = $V_{IL}$ , CE2 = $V_{IH}$ , Page add. cycling, $I_{OUT} = 0\text{ mA}$ $t_{PC} = \text{min}$	-	-	25	mA
$I_{DDS}$	Standby Current (MOS)	CE1# = $V_{DD} - 0.2\text{ V}$ , CE2 = $V_{DD} - 0.2\text{ V}$	-	-	70	$\mu\text{A}$
$I_{DDSD}$	Deep Power-down Standby Current	CE2 = $0.2\text{ V}$	-	-	5	$\mu\text{A}$

**Notes:**

- $I_{DDO}$  depends on the cycle time.
- $I_{DDO}$  depends on output loading. Specified values are defined with the output open condition.

**Table 23. Capacitance ( $T_A = 25^\circ\text{C}$ ,  $f = 1\text{ MHz}$ )**

Symbol	Parameter	Test Condition	Max	Unit
$C_{IN}$	Input Capacitance	$V_{IN} = \text{GND}$	10	pF
$C_{OUT}$	Output Capacitance	$V_{OUT} = \text{GND}$	10	pF

## AC Characteristics

$t_{CHC}$	CE2 Hold from CE1#	0	–	ns
$t_{CHP}$	CE2 Hold from Power On	30	–	$\mu\text{s}$

**Notes:**

1. AC measurements are assumed  $t_R, t_F = 5$  ns.
2. Parameters  $t_{OD}, t_{ODO}, t_{BD}$  and  $t_{ODW}$  define the time at which the output goes the open condition and are not output voltage reference levels.
3. Data cannot be retained at deep power-down stand-by mode.
4. If OE# is high during the write cycle, the outputs will remain at high impedance.
5. During the output state of I/O signals, input signals of reverse polarity must not be applied.
6. If CE1# or LB#/UB# goes LOW coincident with or after WE# goes LOW, the outputs will remain at high impedance.
7. If CE1# or LB#/UB# goes HIGH coincident with or before WE# goes HIGH, the outputs will remain at high impedance.

**Table 25. AC Test Conditions**

Parameter	Condition
Output load	30 pF + 1 TTL Gate
Input pulse level	$V_{DD} - 0.2$ V, 0.2 V
Timing measurements	$V_{DD} \times 0.5$
Reference level	$V_{DD} \times 0.5$
$t_R, t_F$	5 ns

### Timing Diagrams

$V_{DD}$	Power Supply Voltage	-1.0 to 3.6	V
$V_{IN}$	Input Voltage	-1.0 to 3.6	V
$V_{OUT}$	Output Voltage	-1.0 to 3.6	V
$T_{opr.}$	Operating Temperature	-25 to 85	°C
$T_{strg.}$	Storage Temperature	-55 to 150	°C
$P_D$	Power Dissipation	0.6	W
$I_{OUT}$	Short Circuit Output Current	50	mA

**Note:** (Stresses greater than listed under "Absolute Maximum Ratings" may cause permanent damage to the device)

## DC Characteristics

**Table 26. DC Recommended Operating Conditions ( $T_A = -25^\circ\text{C}$  to  $85^\circ\text{C}$ )**

SYMBOL	PARAMETER	MIN	TYP.	MAX	UNIT
$V_{DD}$	Power Supply Voltage	2.6	2.75	3.3	V
$V_{IH}$	Input High Voltage	2.0	-	$V_{DD} + 0.3$ (Note)	
$V_{IL}$	Input Low Voltage	-0.3 (Note)	-	0.4	

**Note:**  $V_{IL}(\text{Min})$  -1.0 V with 10 ns pulse width;  $V_{IH}(\text{Max})$   $V_{DD}+1.0$  V with 10 ns pulse width

**Table 27. DC Characteristics ( $T_A = -25^\circ\text{C}$  to  $85^\circ\text{C}$ ,  $V_{DD} = 2.6$  to  $3.3\text{V}$ )**

SYMBOL	PARAMETER	TEST CONDITION	MIN	TYP.	MAX	UNIT
$I_{IL}$	Input Leakage Current	$V_{IN} = 0\text{ V to }V_{DD}$	-1.0	-	+1.0	$\mu\text{A}$
$I_{LO}$	Output Leakage Current	Output disable, $V_{OUT} = 0\text{ V to }V_{DD}$	-1.0	-	+1.0	mA
$V_{OH}$	Output High Voltage	$I_{OH} = -0.5\text{ mA}$	2.4	-	-	V
$V_{OL}$	Output Low Voltage	$I_{OL} = 1.0\text{ mA}$	-	-	0.4	V
$I_{DDO1}$	Operating Current	CE1# = $V_{IL}$ CE2 = $V_{IH}$ , $I_{OUT} = 0\text{ mA}$ $t_{RC} = \text{min}$	-	-	50	mA
$I_{DDO2}$	Page Access Operating Current	CE1# = $V_{IL}$ , CE2 = $V_{IH}$ , Page add. cycling, $I_{OUT} = 0\text{ mA}$ $t_{PC} = \text{min}$	-	-	25	mA
$I_{DDS}$	Standby Current (MOS)	CE1# = $V_{DD} - 0.2\text{ V}$ , CE2 = $V_{DD} - 0.2\text{ V}$	-	-	100	$\mu\text{A}$
$I_{DDSD}$	Deep Power-down Standby Current	CE2 = $0.2\text{ V}$	-	-	5	$\mu\text{A}$

**Notes:**

- $I_{DDO}$  depends on the cycle time.
- $I_{DDO}$  depends on output loading. Specified values are defined with the output open condition.

**Table 28. Capacitance ( $T_A = 25^\circ\text{C}$ ,  $f = 1\text{ MHz}$ )**

SYMBOL	PARAMETER	TEST CONDITION	MAX	UNIT
$C_{IN}$	Input Capacitance	$V_{IN} = \text{GND}$	10	pF
$C_{OUT}$	Output Capacitance	$V_{OUT} = \text{GND}$	10	pF

**AC Characteristics****Table 29. AC Characteristics and Operating Conditions ( $T_A = -25^\circ\text{C}$  to  $85^\circ\text{C}$ ,  $V_{DD} = 2.6$  to  $3.3\text{V}$ )**

Symbol	Parameter	Min	Max	Unit
$t_{RC}$	Read Cycle Time	70	10000	ns
$t_{ACC}$	Address Access Time	-	70	ns
$t_{CO}$	Chip Enable (CE#) Access Time	-	70	ns
$t_{OE}$	Output Enable Access Time	-	25	ns
$t_{BA}$	Data Byte Control Access Time	-	25	ns
$t_{COE}$	Chip Enable Low to Output Active	10	-	ns
$t_{OEE}$	Output Enable Low to Output Active	0	-	ns
$t_{BE}$	Data Byte Control Low to Output Active	0	-	ns
$t_{OD}$	Chip Enable High to Output High-Z	-	20	ns
$t_{ODO}$	Output Enable High to Output High-Z	-	20	ns
$t_{BD}$	Data Byte Control High to Output High-Z	-	20	ns
$t_{OH}$	Output Data Hold Time	10	-	ns
$t_{PM}$	Page Mode Time	70	10000	ns
$t_{PC}$	Page Mode Cycle Time	30	-	ns

**Table 29. AC Characteristics and Operating Conditions ( $T_A = -25^{\circ}\text{C}$  to  $85^{\circ}\text{C}$ ,  $V_{DD} = 2.6$  to  $3.3\text{V}$ ) (Continued)**

Symbol	Parameter	Min	Max	Unit
$t_{AA}$	Page Mode Address Access Time	-	30	ns
$t_{AOH}$	Page Mode Output Data Hold Time	10	-	ns
$t_{WC}$	Write Cycle Time	70	10000	ns
$t_{WP}$	Write Pulse Width	50	-	ns
$t_{CW}$	Chip Enable to End of Write	70	-	ns
$t_{BW}$	Data Byte Control to End of Write	60	-	ns
$t_{AW}$	Address Valid to End of Write	60	-	ns
$t_{AS}$	Address Set-up Time	0	-	ns
$t_{WR}$	Write Recovery Time	0	-	ns
$t_{CEH}$	Chip Enable High Pulse Width	10	-	ns
$t_{WEH}$	Write Enable High Pulse Width	15	-	ns
$t_{ODW}$	WE# Low to Output High-Z	-	20	ns
$t_{OEW}$	WE# High to Output Active	0	-	ns
$t_{DS}$	Data Set-up Time	30	-	ns
$t_{DH}$	Data Hold Time	0	-	ns
$t_{CS}$	CE2 Set-up Time	0	-	ns
$t_{CH}$	CE2 Hold Time	300	-	$\mu\text{s}$
$t_{DPD}$	CE2 Pulse Width	10	-	ms
$t_{CHC}$	CE2 Hold from CE1#	0	-	ns
$t_{CHP}$	CE2 Hold from Power On	30	-	$\mu\text{s}$

**Notes:**

1. AC measurements are assumed  $t_R, t_F = 5$  ns.
2. Parameters  $t_{OD}, t_{ODO}, t_{BD}$  and  $t_{ODW}$  define the time at which the output goes the open condition and are not output voltage reference levels.
3. Data cannot be retained at deep power-down stand-by mode.
4. If OE# is high during the write cycle, the outputs will remain at high impedance.
5. During the output state of I/O signals, input signals of reverse polarity must not be applied.
6. If CE1# or LB#/UB# goes LOW coincident with or after WE# goes LOW, the outputs will remain at high impedance.
7. If CE1# or LB#/UB# goes HIGH coincident with or before WE# goes HIGH, the outputs will remain at high impedance.

**Table 30. AC Test Conditions**

Parameter	Condition
Output load	30 pF + 1 TTL Gate
Input pulse level	$V_{DD} - 0.2$ V, 0.2 V
Timing measurements	$V_{DD} \times 0.5$
Reference level	$V_{DD} \times 0.5$
$t_R, t_F$	5 ns

## Timing Diagrams

**Figure 52. Read Cycle**

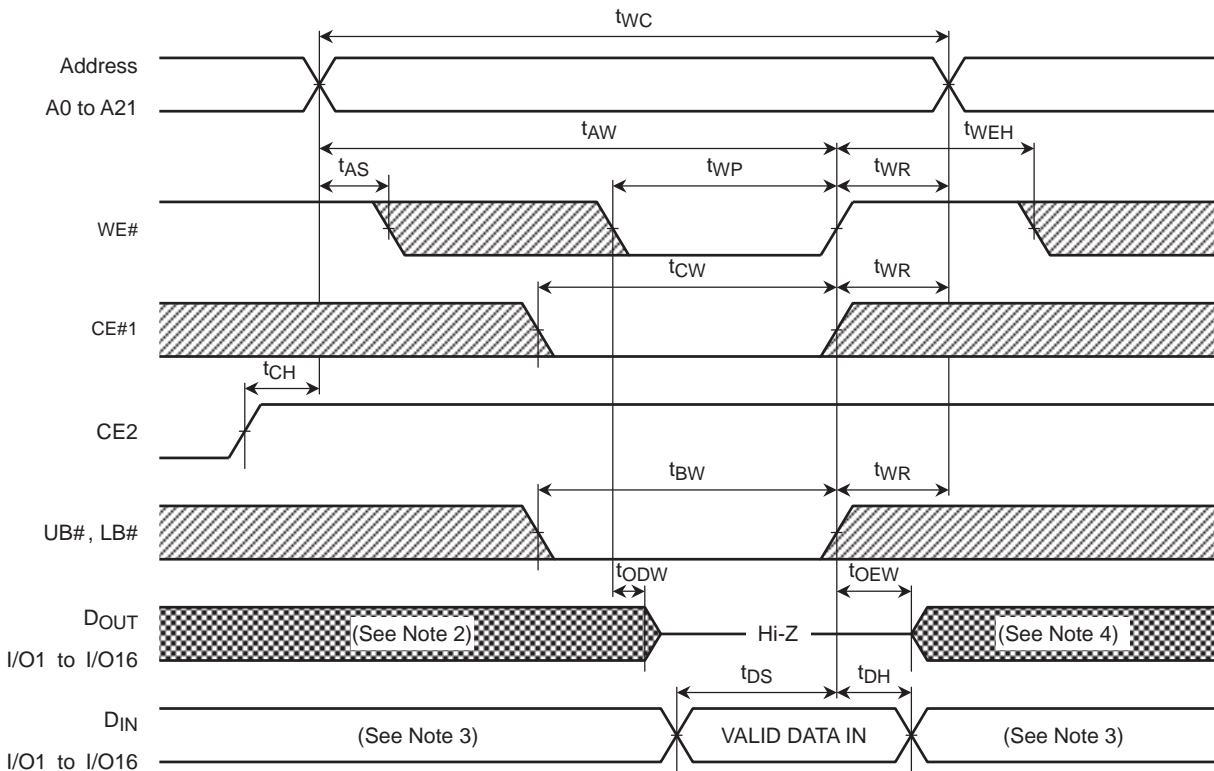

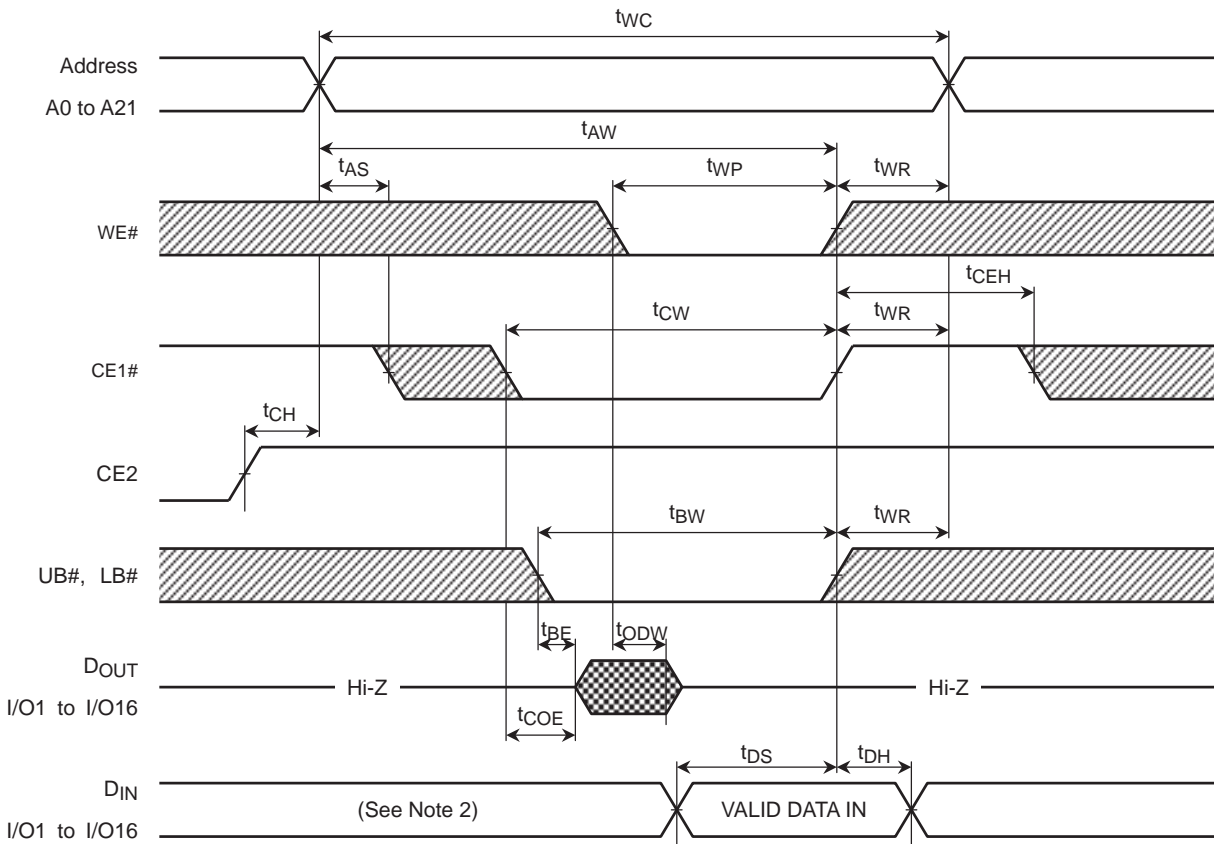

Figure 53. Page Read Cycle (8 words access)

**Notes:**

1. If OE# is high during the write cycle, the outputs will remain at high impedance
2. If CE1# or LB#/UB# goes LOW coincident with or after WE# goes LOW, the outputs will remain at high impedance
3. During the output state of I/O signals, input signals of reverse polarity must not be applied
4. If CE1# or LB#/UB# goes HIGH coincident with or before WE# goes HIGH, the outputs will remain at high impedance

**Figure 54. Write Cycle I (WE# controlled)**

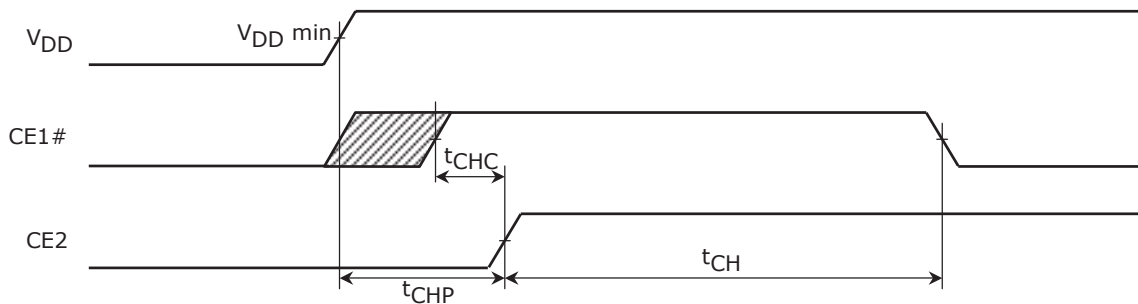

**Notes:**

1. If OE# is high during the write cycle, the outputs will remain at high impedance
2. During the output state of I/O signals, input signals of reverse polarity must not be applied

**Figure 55. Write Cycle 2 (CE# controlled)**

**Figure 56. Deep Power-down Timing**

**Figure 57. Power-on Timing**

**Note:** If multiple invalid address cycles shorter than  $t_{RC min}$  occur for a period greater than 10  $\mu s$ , at least one valid address cycle over  $t_{RC min}$  is required during that period.

**Figure 58. Read Address Skew Provisions**

**Note:** If multiple invalid address cycles shorter than  $t_{WC min}$  occur for a period greater than 10  $\mu s$ , at least one valid address cycle over  $t_{WC min}$ , in addition to  $t_{WP min}$ , is required during that period.

**Figure 59. Write Address Skew Provisions**

# 8 Mb SRAM (supplier I)

## 8 Megabit (x8/x16) CMOS SRAM

### Functional Description

Table 31. Word Mode

CS1#	CS#2	OE#	WE#	BYTE#	SA	LB#	UB#	DQ <sub>0-7</sub>	DQ <sub>8-15</sub>	Mode	Power
H	X	X	X	X	X	X	X	High-Z	High-Z	Deselected	Standby

L	H	X	L	V <sub>SS</sub>	SA (Note 2)	DNU	DNU	D <sub>in</sub>	DNU	Lower Byte Write	Active

**Notes:**

1. X = V<sub>IL</sub> or V<sub>IH</sub>
2. Address input for byte operation.

## Absolute Maximum Ratings

Item	Symbol	Ratings	Unit
Voltage on any pin relative to $V_{SS}$	$V_{IN}, V_{OUT}$	-0.2 to $V_{CC}+0.3V$ (Max. 3.6V)	V
Voltage on $V_{CC}$ supply relative to $V_{SS}$	$V_{CC}$	-0.2 to 3.6V	V
Power Dissipation	$P_D$	1.0	W
Operating Temperature	$T_A$	-40 to 85	°C

Stresses greater than those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. Functional operation should be restricted to recommended operating condition. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

## DC Characteristics

### Recommended DC Operating Conditions

Item	Symbol	Min	Typ	Max	Unit
Supply voltage	$V_{CC}$	2.7	3.0	3.3	V
Ground	$V_{SS}$	0	0	0	V
Input high voltage	$V_{IH}$	2.2	-	$V_{CC}+0.2$ (Note 1)	V
Input low voltage	$V_{IL}$	-0.2 (Note 2)	-	0.6	V

#### Notes:

1. Overshoot:  $V_{CC}+1.0V$  in case of pulse width  $\leq 20ns$ .
2. Undershoot:  $-1.0V$  in case of pulse width  $\leq 20ns$ .
3. Overshoot and undershoot are sampled, not 100% tested.

### Capacitance ( $f=1MHz, T_A=25^\circ C$ )

Item	Symbol	Test Condition	Min	Max	Unit
Input capacitance	$C_{IN}$	$V_{IN}=0V$	-	8	pF
Input/Output capacitance	$C_{IO}$	$V_{IO}=0V$	-	10	pF

**Note:** Capacitance is sampled, not 100% tested

### DC and Operating Characteristics

Item	Symbol	Test Conditions	Min	Typ	Max	Unit
Input leakage current	$I_{LI}$	$V_{IN}=V_{SS}$ to $V_{CC}$	-1	-	1	mA
Output leakage current	$I_{LO}$	$CE1\#=V_{IH}$ , $CS2=V_{IL}$ or $OE\#=V_{IH}$ or $WE\#=V_{IL}$ , $V_{IO}=V_{SS}$ to $V_{CC}$	-1	-	1	mA
Average operating current	$I_{CC1}$	Cycle time=1 $\mu$ s, 100% duty, $I_{IO}=0$ mA, $CE1\#\leq 0.2$ V, $CS2\geq V_{CC}-0.2$ V, $BYTE\#=V_{SS}$ or $V_{CC}$ , $V_{IN}\leq 0.2$ V or $V_{IN}\geq V_{CC}-0.2$ V	-	-	3	mA
	$I_{CC2}$	Cycle time=Min, $I_{IO}=0$ mA, 100% duty, $CE1\#=V_{IL}$ , $CS2=V_{IH}$ , $BYTE\#=V_{SS}$ or $V_{CC}$ , $V_{IN}=V_{IL}$ or $V_{IH}$	70ns	-	-	22
Output low voltage	$V_{OL}$	$I_{OL} = 2.1$ mA	-	-	0.4	V
Output high voltage	$V_{OH}$	$I_{OH} = -1.0$ mA	2.4	-		V
Standby Current (CMOS)	$I_{SB1}$	$CE1\#\geq V_{CC}-0.2$ V, $CS2\geq V_{CC}-0.2$ V ( $CE1\#$ controlled) or $CS2\leq 0.2$ V( $CS2$ controlled), $BYTE3=V_{SS}$ or $V_{CC}$ , Other input =0~ $V_{CC}$	-	-	15	mA

## AC Characteristics

### Read/Write Characteristics ( $V_{CC}=2.7-3.3V$ )

	Parameter List	Symbol	Min	Max	Units
Read	Read cycle time	$t_{RC}$	70	-	ns
	Address access time	$t_{AA}$	-	70	ns
	Chip select to output	$t_{CO1}, t_{CO2}$	-	70	ns
	Output enable to valid output	$t_{OE}$	-	35	ns
	UB#, LB# Access Time	$t_{BA}$	-	70	ns
	Chip select to low-Z output	$t_{LZ1}, t_{LZ2}$	10	-	ns
	UB#, LB# enable to low-Z output	$t_{BLZ}$	10	-	ns
	Output enable to low-Z output	$t_{OLZ}$	5	-	ns
	Chip disable to high-Z output	$t_{HZ1}, t_{HZ2}$	0	25	ns
	UB#, LB# disable to high-Z output	$t_{BHZ}$	0	25	ns
	Output disable to high-Z output	$t_{OHZ}$	0	25	ns
	Output hold from address change	$t_{OH}$	10	-	ns
	Write	Write cycle time	$t_{WC}$	70	-
Chip select to end of write		$t_{CW}$	60	-	ns
Address set-up time		$t_{AS}$	0	-	ns
Address valid to end of write		$t_{AW}$	60	-	ns
UB#, LB# Valid to End of Write		$t_{BW}$	60	-	ns
Write pulse width		$t_{WP}$	50	-	ns
Write recovery time		$t_{WR}$	0	-	ns
Write to output high-Z		$t_{WHZ}$	0	20	ns
Data to write time overlap		$t_{DW}$	30	-	ns
Data hold from write time		$t_{DH}$	0	-	ns
End write to output low-Z		$t_{OW}$	5	-	ns

### Data Retention Characteristics

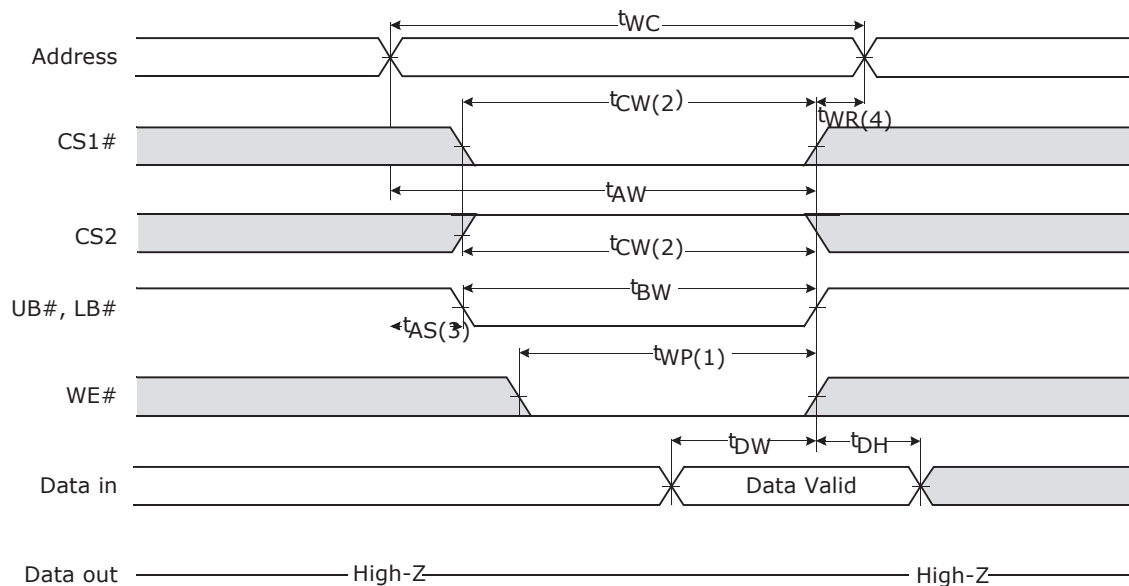

Item	Symbol	Test Condition	Min	Typ	Max	Unit
$V_{CC}$ for data retention	$V_{DR}$	$CS1\# \geq V_{CC} - 0.2V$	1.5	-	3.3	V
Data retention current	$I_{DR}$	$V_{CC} = 3.0V, CS1\# \geq V_{CC} - 0.2V$	-	-	15	$\mu A$
Data retention set-up time	$t_{SDR}$	See data retention waveform	0	-	-	ns
Recovery time	$t_{RDR}$		$t_{RC}$	-	-	

**Note:**  $CE1\# \leq V_{CC} - 0.2V$ .  $CS2 \leq V_{CC} - 0.2V$  ( $CE1\#$  controlled) or  $CS2 \leq 0.2V$  ( $CS2$  controlled),  $BYTE\# = V_{SS}$  or  $V_{CC}$

**Figure 63. Timing Waveform of Write Cycle(2) (CEI# controlled, if BYTE# is low, ignore UB#/LB# timing)**

**Notes:**

1. A write occurs during the overlap( $t_{WP}$ ) of low CS1# and low WE#. A write begins when CS1# goes low and WE# goes low with asserting UB# or LB# for single byte operation or simultaneously asserting UB# and LB# for double byte operation. A write ends at the earliest transition when CS1# goes high and WE# goes high. The  $t_{WP}$  is measured from the beginning of write to the end of write.
2.  $t_{CW}$  is measured from the CS1# going low to the end of write.
3.  $t_{AS}$  is measured from the address valid to the beginning of write.
4.  $t_{WR}$  is measured from the end of write to the address change.  $t_{WR}$  applied in case a write ends as CS1# or WE# going high.

**Figure 64. Timing Waveform of Write Cycle(3) (UB#, LB# controlled, BYTE# must be high)**

Data Retention Waveforms

Figure 66. CS2 Controlled

## Revision Summary

### Revision A (February 23, 2004)

Initial release.

### Revision A+1 (February 25, 2004)

**Global**

Corrected Supplier 4 Model Number to 62.

### Revision A+2 (February 26, 2004)

**Global**

Corrected missed Supplier 4 Model Number to 62.
