

**QUAD OP AMP AND VOLTAGE REFERENCE****AP4302****General Description**

The AP4302 is a monolithic IC specifically designed to regulate the output current and voltage levels of switching battery chargers and power supplies.

The device contains quad Op Amps and a 2.5V externally adjusted voltage reference in a 16-pin package. The four Op Amps feature accurate voltage and current control. Combining a stable voltage reference with the four Op Amps makes AP4302 ideal for use in multi-function charger, power supply voltage monitor, signal processing and control system.

The IC offers the power converter designer a control solution that features increased precision with a corresponding reduction in system complexity and cost.

The AP4302 is available in standard packages of DIP-16 and SOIC-16.
