Description

The B9940L is a low-voltage clock distribution buffer with the capability to select either a differential LVPECL- or an LVCMOS/LVTTL-compatible input clock. The two clock sources can be used to provide for a test clock as well as the primary system clock. All other control inputs are LVCMOS/LVTTL compatible. The eighteen outputs are 2.5V or 3.3V compatible and can drive two series-terminated 50Ω transmission lines. With this capability the B9940L has an effective fan-out of 1:36. Low output-to-output skews make the B9940L an ideal clock distribution buffer for nested clock trees in the most demanding of synchronous systems.

This device contains circuitry to protect the inputs against damage due to high static voltages or electric field; however, precautions should be taken to avoid application of any voltage higher than the maximum rated voltages to this circuit. For proper operation, V_{in} and V_{out} should be constrained to the

 $V_{SS} < (V_{in} \text{ or } V_{out}) < V_{DD}.$

Unused inputs must always be tied to an appropriate logic voltage level (either V_{SS} or V_{DD}).

DC Parameters $V_{DD} = 3.3V \pm 5\%$ or 2.5V $\pm 5\%$, $V_{DDC} = 3.3V \pm 5\%$ or 2.5V $\pm 5\%$, $T_A = -40$ °C to +85°C

Notes:

- The voltage on any input or I/O pin cannot exceed the power pin during power-up. Power suppl sequencing is NOT required.
- Inputs have pull-up/pull-down resistors that effect input current.

 The V_{CMR} is the difference from the most positive side of the differential input signal. Normal operation is obtained when the "High" input is within the V_{CMR} range and the input lies within the $V_{\mbox{\footnotesize{PP}}}$ specification.
- Driving series or parallel terminated 50Ω (or 50Ω to $V_{DD}\!/2)$ transmission lines.
- Parameters are guaranteed by design and characterization. Not 100% tested in production. All parameters specified with loaded outputs. Outputs driving 50Ω transmission lines. 50% input duty cycle.

 Outputs loaded with 30 pF each.

 Across temperature and voltage ranges, includes output skew.

AC Parameters $V_{DD} = 3.3 \text{V} \pm 5\%$ or $2.5 \text{V} \pm 5\%$, $V_{DDC} = 3.3 \text{V} \pm 5\%$ or $2.5 \text{V} \pm 5\%$, $T_A = -40 ^{\circ}\text{C}$ to $+85 ^{\circ}\text{C}$ (continued) [6]
