# CHAPTER 1 OUTLINE

The S1C6P366 is a microcomputer which has a high-performance 4-bit CPU S1C63000 as the core CPU, rewritable PROM, RAM, serial interface, watchdog timer, programmable timer, time base counter (1 system), SVD circuit, a segment type LCD driver (32 segments  $\times$  4 commons), A/D converter and a special input port that can implement key position discrimination function using with the A/D converter. The S1C6P366 has a built-in large capacity PROM (16K  $\times$  13 bits) and RAM (2K  $\times$  4 bits) that are compatible with the S1C63358 and S1C63158, it can therefore be used as an MTP (Multi-Time Programming) for program development.

## 1.1 Features

---

OSC1 oscillation circuit .....	32.768 kHz (Typ.) crystal oscillation circuit
OSC3 oscillation circuit .....	1.8 MHz (Typ.) CR or 4 MHz (Max.) ceramic oscillation circuit (*1)
Instruction set .....	Basic instruction: 46 types (411 instructions with all) Addressing mode: 8 types
Instruction execution time .....	At 32.768 kHz operation: Min. 61 $\mu$ sec At 4 MHz operation: Min. 0.5 $\mu$ sec
PROM capacity .....	Code PROM: 16,384 words $\times$ 13 bits Segment option PROM: 2,048 words $\times$ 4 bits Programming method: Parallel or serial programming (exclusive PROM writer is used) Rewriting: 100 times
RAM capacity .....	Data memory: 2,048 words $\times$ 4 bits Display memory: 32 words $\times$ 4 bits
Input port .....	9 bits 8 bits (with pull-up resistors) 1 bit (for key position sensing interrupt by A/D)
Output port .....	12 bits (2 special outputs are available *2)
I/O port .....	20 bits (4 serial inputs/outputs are available *2) (4 A/D inputs are available *2)
Serial interface .....	1 port (8-bit clock synchronous system)
LCD driver .....	32 segments $\times$ 4, 3 or 2 commons (*2), 1/3 bias drive
Time base counter .....	1 system (clock timer)
Programmable timer .....	Built-in, 2 channels $\times$ 8 bits or 1 channel $\times$ 16 bits (*2), with event counter function
Watchdog timer .....	Built-in
A/D converter .....	8-bit resolution Maximum error: $\pm 3$ LSB, A/D clock: OSC1, OSC3 (2.7 V to 5.5 V)
Buzzer output .....	Buzzer frequency: 2 kHz or 4 kHz (*2), 2 Hz interval output (*2)
Supply voltage detection (SVD) circuit ...	2 values, programmable (2.7 V, 2.8 V)
External interrupt .....	Input port interrupt: 2 systems Key sensing interrupt: 1 system
Internal interrupt .....	Clock timer interrupt: 4 systems Programmable timer interrupt: 2 systems Serial interface interrupt: 1 system A/D converter: 1 system
Power supply voltage .....	2.7 V to 5.5 V
Operating temperature range .....	-20°C to 70°C

---

Current consumption (Typ.) .....	Single clock:		
	During HALT (32 kHz)	3.0 V (LCD power OFF)	2.5 $\mu$ A
		3.0 V (LCD power ON)	37 $\mu$ A
	During operation (32 kHz)	3.0 V (LCD power ON)	120 $\mu$ A
	Twin clock:		
	During operation (4 MHz)	3.0 V (LCD power ON)	800 $\mu$ A
Package .....	QFP15-100pin (plastic) or chip		
	*1: Can be selected with mask option *2: Can be selected with software

## 1.4 Pin Description

Table 1.4.1 Pin description

Pin name	Pin No.	In/Out	Function
VDD	43	–	Power (+) supply pin
VSS	37	–	Power (–) supply pin
VD1	40	–	Oscillation system regulated voltage output pin
VC1–VC3	36–34	–	LCD system power supply pin 1/3 bias
CA, CB	33, 32	–	LCD system boosting/reducing capacitor connecting pin
OSC1	38	I	Crystal oscillation input pin
OSC2	39	O	Crystal oscillation output pin
OSC3	41	I	Ceramic or CR oscillation input pin (selected by mask option)
OSC4	42	O	Ceramic or CR oscillation output pin (selected by mask option)
K00–K03	85–88	I	Input port
K10–K13	89–92	I	Input port
K20	93	I	Input port with control
P00–P03	71–68	I/O	I/O port
P10–P13	67–64	I/O	I/O port (switching to serial I/F input/output is possible by software)
P20–P23	63–60	I/O	I/O port
P30–P33	59–56	I/O	I/O port
P40–P43	55–52	I/O	I/O port (can be used as A/D input)
R00	83	O	Output port
R01	82	O	Output port
R02	81	O	Output port (switching to TOUT output is possible by software)
R03	80	O	Output port (switching to FOUT output is possible by software)
R10–R13	79–76	O	Output port
R20–R23	75–72	O	Output port
COM0–COM3	28–31	O	LCD common output pin (1/4, 1/3, 1/2 duty can be selected by software)
SEG0–SEG31	94–100, 1–25	O	LCD segment output pin
AVDD	47	–	Power (+) supply pin for A/D converter
AVSS	48	–	Power (–) supply pin for A/D converter
AVREF	46	–	Reference voltage for A/D converter
BZ	84	O	Buzzer output pin
RESET	44	I	Initial reset input pin
TEST	45	I	Testing input pin
RXD *1	49	I	Serial data input pin for Flash programming
TXD *1	50	O	Serial data output pin for Flash programming
SCLK *1	51	I/O	Serial clock input/output pin for Flash programming
CLKIN *1	26	I	Clock input pin for Flash programming
SPRG *1	27	I	Control pin for Flash programming

\*1 N.C. in S1C63358

Refer to Chapter 5, "PROM Programmer and Operating Mode", for the Flash programming pins.

### 1.5 Mask Option

Mask options shown below are provided for the S1C6P366.

### <S1C6P366 mask options>

### (1) OSC3 oscillation circuit

Either CR oscillation circuit or ceramic oscillation circuit can be selected as the OSC3 oscillation circuit.

Refer to Section 4.3.3, "OSC3 oscillation circuit", for details.

The other mask options provided for the S1C63358/63158 are fixed as follows in the S1C6P366, so they cannot be selected.

- |   |                      |
|---|----------------------|
| • OSC1 oscillation circuit .....                | Crystal oscillation  |
| • Multiple key input reset .....                | Not used             |
| • Time authorize for multiple key input.....    | Not used             |
| • Input port pull-up resistor .....             | Available            |
| • Output port output specifications .....       | Complementary output |
| • I/O port output specifications .....          | Complementary output |
| • I/O port pull-up resistor P1x, P2x, P3x ..... | Available            |
| P4x .....                                       | Not available        |
| • LCD drive bias .....                          | 1/3 bias             |
| • Serial interface input/output polarity .....  | Negative polarity    |
| • Buzzer output specification .....             | Negative polarity    |

### 1.6 Segment Option

### (1) LCD segment allocation

Up to 128 bits of the display memory can be selected from the data memory addresses F000H to F01FH. The LCD driver has a segment decoder built-in, and the data bit (D0–D3) of the optional address in the display memory area (F000H–F01FH) can be allocated to the optional segment. The segment option generator SOG63358, that has been prepared as a development software tool of the S1C63358, is used for this selection.

Refer to Section 4.7.4, "Segment option", for details.

### (2) LCD segment output specification

It is possible to set the optional SEG terminal for DC output.

Refer to Section 4.7.4, "Segment option", for details.

### (3) Segment option data

Recommended LCD segment option data is include in the S5U1C6P366Y1 package. Modifying the LCD segment opotion is done at the user's own risk.

## CHAPTER 2 POWER SUPPLY AND INITIAL RESET

## 2.1 Power Supply

The S1C6P366 operating power voltage is as follows:

2.7 V to 5.5 V

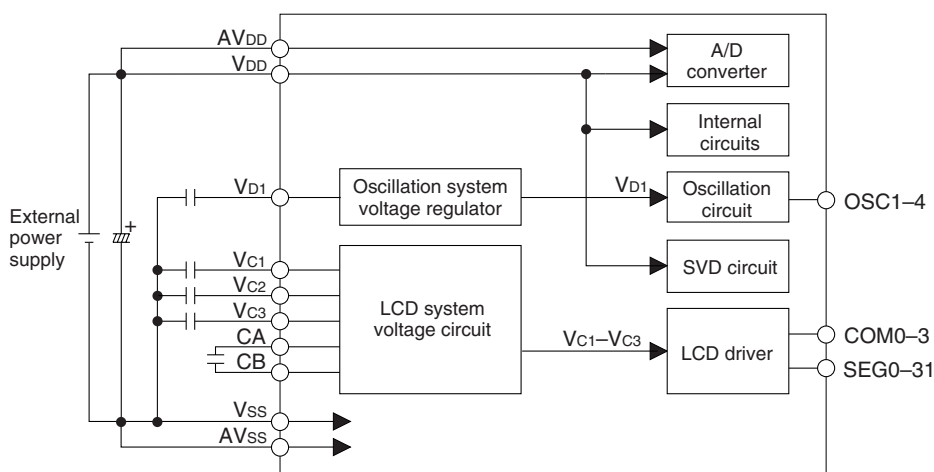

The S1C6P366 operates by applying a single power supply within the above range between  $V_{DD}/AV_{DD}$  and  $V_{SS}/AV_{SS}$ . The S1C6P366 itself generates the voltage necessary for all the internal circuits by the built-in power supply circuits shown in Table 2.1.1.

*Table 2.1.1 Power supply circuits*

Circuit	Power supply circuit	Output voltage
Oscillation circuit	Oscillation system voltage regulator	V <sub>D1</sub>
Internal logic circuits	Supply voltage (V <sub>DD</sub> )	V <sub>DD</sub>
LCD driver	LCD system voltage circuit	V <sub>C1</sub> –V <sub>C3</sub>
Oscillation system voltage regulator	Supply voltage (V <sub>DD</sub> )	V <sub>DD</sub>
LCD system voltage circuit	Supply voltage (V <sub>DD</sub> )	V <sub>DD</sub>
A/D converter	Analog supply voltage (A V <sub>DD</sub> ) and supply voltage (V <sub>DD</sub> )	A V <sub>DD</sub> and V <sub>DD</sub>

*Note:*

- Do not drive external loads with the output voltage from the internal power supply circuits.
- The internal LCD system voltage circuit (1/3 bias) is always used in the S1C6P366.
- See Chapter 9, "Electrical Characteristics", for voltage values and drive capability.

*Fig. 2.1.1 Configuration of power supply*

### ***2.1.1 Voltage <VD1> for oscillation circuit and internal circuits***

VD1 is the operating voltage for the oscillation circuit, and is generated by the oscillation system voltage regulator for stabilizing oscillation.

In the S1C63358/63158, it is necessary to switch the VD1 voltage level according to the oscillation circuit and operating frequency by controlling the voltage regulator. In the S1C6P366, the VD1 voltage level is fixed, so software control for switching the VD1 level does not affect the actual output voltage. However, when using the S1C6P366 as a development tool for the S1C63358/63158, the VD1 software control sequence must be implemented according to the model.

Refer to Chapter 6, "Differences from Mask ROM Models", for details.

### ***2.1.2 Voltage <VC1–VC3> for LCD driving***

VC1 to VC3 are the voltages for LCD drive, and are generated by the LCD system voltage circuit to stabilize the display quality.

Since the minimum operating voltage of the S1C6P366 is 2.7 V, the LCD system voltage circuit generates VC2 as the reference voltage, and generates two other voltages by boosting or reducing VC2 ( $VC1 = 1/2 \cdot VC2$ ,  $VC3 = 3/2 \cdot VC2$ ).

Refer to Chapter 9, "Electrical Characteristics", for voltage values of VC1 to VC3.

### ***2.1.3 Operating mode of power supply circuit***

The oscillation system voltage regulator and A/D converter power supply circuit operate in normal mode that uses VDD as the power source.

In the S1C63358/63158, a booster mode (VC2 mode) is provided in order to guarantee low-voltage operation, therefore it is necessary to switch the operating mode. Since the power supply voltage of the S1C6P366 is 2.7 V or more, this switching is not necessary and the software control does not affect the operating mode. However, when using the S1C6P366 as a development tool for the S1C63358/63158, the operating mode control routine must be implemented according to the model.

Refer to Chapter 6, "Differences from Mask ROM Models", for details.

## 2.2 Initial Reset

To initialize the S1C6P366 circuits, initial reset must be executed. The S1C6P366 supports an external initial reset using the reset ( $\overline{\text{RESET}}$ ) terminal.

When the power is turned on, be sure to initialize using this reset function. It is not guaranteed that the circuits are initialized by only turning the power on.

Figure 2.2.1 shows the configuration of the initial reset circuit.

Fig. 2.2.1 Configuration of initial reset circuit

### 2.2.1 Reset terminal ( $\overline{\text{RESET}}$ )

Initial reset can be executed externally by setting the reset terminal to a low level ( $V_{SS}$ ). After that the initial reset is released by setting the reset terminal to a high level ( $V_{DD}$ ) and the CPU starts operation. The reset input signal is maintained by the RS latch and becomes the internal initial reset signal. The RS latch is designed to be released by a 2 Hz signal (high) that is divided by the OSC1 clock. Therefore in normal operation, a maximum of 250 msec (when  $f_{OSC1} = 32.768 \text{ kHz}$ ) is needed until the internal initial reset is released after the reset terminal goes to high level. Be sure to maintain a reset input of 0.1 msec or more.

However, when turning the power on, the reset terminal should be set at a low level as in the timing shown in Figure 2.2.1.1.

Fig. 2.2.1.1 Initial reset at power on

The reset terminal should be set to  $0.1 \cdot V_{DD}$  or less (low level) until the supply voltage becomes 2.7 V or more. After that, a level of  $0.5 \cdot V_{DD}$  or less should be maintained more than 2.0 msec.

In the S1C6P366, a low level input to the reset terminal initializes some analog circuits as well as the internal logic. At this time, 10  $\mu\text{A}$  or more current is consumed as the bias current.

### 2.2.2 Internal register at initial resetting

Initial reset initializes the CPU as shown in Table 2.2.2.1.

The registers and flags which are not initialized by initial reset should be initialized in the program if necessary.

In particular, the stack pointers SP1 and SP2 must be set as a pair because all the interrupts including NMI are masked after initial reset until both the SP1 and SP2 stack pointers are set with software.

When data is written to the EXT register, the E flag is set and the following instruction will be executed in the extended addressing mode. If an instruction which does not permit extended operation is used as the following instruction, the operation is not guaranteed. Therefore, do not write data to the EXT register for initialization only.

Refer to the "S1C63000 Core CPU Manual" for extended addressing and usable instructions.

Table 2.2.2.1 Initial values

CPU core				Peripheral circuits		
Name	Symbol	Number of bits	Setting value	Name	Number of bits	Setting value
Data register A	A	4	Undefined	RAM	4	Undefined
Data register B	B	4	Undefined	Display memory	4	Undefined

Index register X	X	16	Undefined			
Index register Y	Y	16	Undefined			
Program counter	PC	16	0110H			
Stack pointer SP1	SP1	8	Undefined			
Stack pointer SP2	SP2	8	Undefined			
Zero flag	Z	1	Undefined			
Carry flag	C	1	Undefined			
Interrupt flag	I	1	0			
Extension flag	E	1	0			
Queue register	Q	16	Undefined			

\* See Section 4.1, "Memory Map".

### 2.2.3 Terminal settings at initial resetting

The output port (R) terminals and I/O port (P) terminals are shared with special output terminals, input/output terminals of the serial interface and input terminals of the A/D converter. These functions are selected by the software. At initial reset, these terminals are set to the general purpose output port terminals and I/O port terminals. Set them according to the system in the initial routine. In addition, take care of the initial status of output terminals when designing a system.

Table 2.2.3.1 shows the list of the shared terminal settings.

Table 2.2.3.1 List of shared terminal settings

Terminal name	Terminal status at initial reset	Special output		Serial I/F		A/D converter
		TOUT	FOUT	Master	Slave	
R00	R00 (High output)					
R01	R01 (High output)					
R02	R02 (High output)	TOUT				
R03	R03 (High output)		FOUT			
R10–R13	R10–R13 (High output)					
R20–R23	R20–R23 (High output)					
P00–P03	P00–P03 (Input & Pull-up)					
P10	P10 (Input & Pull-up)			SIN(I)	SIN(I)	
P11	P11 (Input & Pull-up)			SOUT(O)	SOUT(O)	
P12	P12 (Input & Pull-up)			SCLK(O)	SCLK(I)	
P13	P13 (Input & Pull-up)				SRDY(O)	
P20–P23	P20–P23 (Input & Pull-up)					
P30–P33	P30–P33 (Input & Pull-up)					
P40	P40 (Input & high impedance)					AD0(I)
P41	P41 (Input & high impedance)					AD1(I)
P42	P42 (Input & high impedance)					AD2(I)
P43	P43 (Input & high impedance)					AD3(I)

For setting procedure of the functions, see explanations for each of the peripheral circuits.

### 2.3 Test Terminal ( $\overline{TEST}$ )

---

This is the terminal used for the factory inspection of the IC. During normal operation, connect the  $\overline{TEST}$  terminal to VDD.

### 2.4 Terminals for Flash EEPROM

---

The S1C6P366 has the following terminals used for writing data to the Flash EEPROM and for factory testing.

- $\overline{SPRG}$ : Flash EEPROM programming control terminal
- SCLK: Clock input/output terminal for Flash EEPROM serial programming
- RXD: Data input terminal for Flash EEPROM serial programming
- TXD: Data output terminal for Flash EEPROM serial programming
- CLKIN: Flash EEPROM write-control clock input terminal

The above terminals should be set up according to the operating mode. Refer to Chapter 5, "PROM Programming and Operating Mode", for details.

# CHAPTER 3 CPU, PROM, RAM

## 3.1 CPU

The S1C6P366 has a 4-bit core CPU S1C63000 built-in as its CPU part.  
Refer to the "S1C63000 Core CPU Manual" for the S1C63000.

*Note:* The SLP instruction cannot be used because the SLEEP operation is not assumed in the S1C6P366.

## 3.2 Code PROM

The built-in code PROM is a PROM for loading programs, and has a capacity of 16,384 steps  $\times$  13 bits. The core CPU can linearly access the program space up to step FFFFH from step 0000H, however, the program area of the S1C6P366 is step 0000H to step 3FFFH. The program start address after initial reset is assigned to step 0110H. The non-maskable interrupt (NMI) vector and hardware interrupt vectors are allocated to step 0100H and steps 0102H–010EH, respectively.

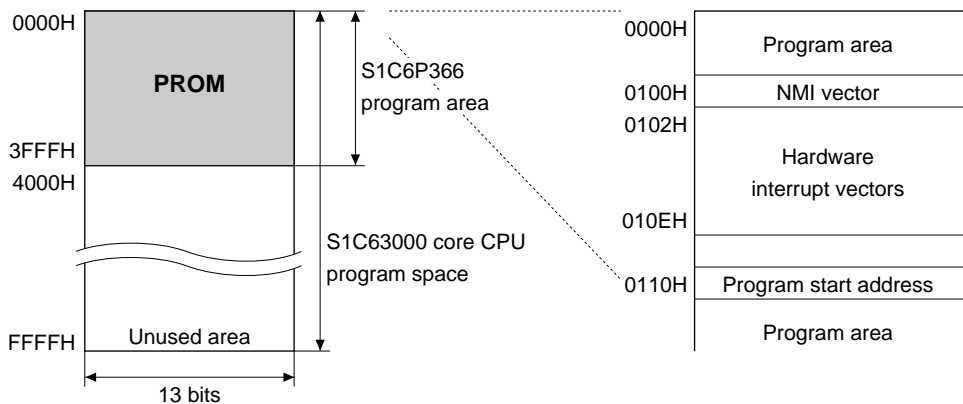

Fig. 3.2.1 Configuration of code PROM

## 3.3 RAM

The RAM is a data memory for storing various kinds of data, and has a capacity of 2,048 words  $\times$  4 bits. The RAM area is assigned to addresses 0000H to 07FFH on the data memory map. Addresses 0100H to 01FFH are 4-bit/16-bit data accessible areas and in other areas it is only possible to access 4-bit data. When programming, keep the following points in mind.

- (1) Part of the RAM area is used as a stack area for subroutine call and register evacuation, so pay attention not to overlap the data area and stack area.
- (2) The S1C63000 core CPU handles the stack using the stack pointer for 4-bit data (SP2) and the stack pointer for 16-bit data (SP1).  
16-bit data are accessed in stack handling by SP1, therefore, this stack area should be allocated to the area where 4-bit/16-bit access is possible (0100H to 01FFH). The stack pointers SP1 and SP2 change cyclically within their respective range: the range of SP1 is 0000H to 03FFH and the range of SP2 is 0000H to 00FFH. Therefore, pay attention to the SP1 value because it may be set to 00FFH or less exceeding the 4-bit/16-bit accessible range in the S1C6P366. Memory accesses except for stack operations by SP1 are 4-bit data access.

After initial reset, all the interrupts including NMI are masked until both the stack pointers SP1 and SP2 are set by software. Further, if either SP1 or SP2 is re-set when both are set already, the interrupts including NMI are masked again until the other is re-set. Therefore, the settings of SP1 and SP2 must be done as a pair.

- (3) Subroutine calls use 4 words (for PC evacuation) in the stack area for 16-bit data (SP1). Interrupts use 4 words (for PC evacuation) in the stack area for 16-bit data (SP1) and 1 word (for F register evacuation) in the stack area for 4-bit data.

*Fig. 3.3.1 Configuration of data RAM*

## CHAPTER 4 PERIPHERAL CIRCUITS AND OPERATION

The peripheral circuits of the S1C6P366 (timer, A/D, I/O, etc.) are interfaced with the CPU in the memory mapped I/O method. Thus, all the peripheral circuits can be controlled by accessing the I/O memory on the memory map using the memory operation instructions. The following sections explain the detailed operation of each peripheral circuit.

### 4.1 Memory Map

The S1C6P366 data memory consists of 2,048-word RAM, 32-word display memory and 76-word peripheral I/O memory area. Figure 4.1.1 shows the overall memory map of the S1C6P366, and Tables 4.1.1(a)–(f) the peripheral circuits' (I/O space) memory maps.

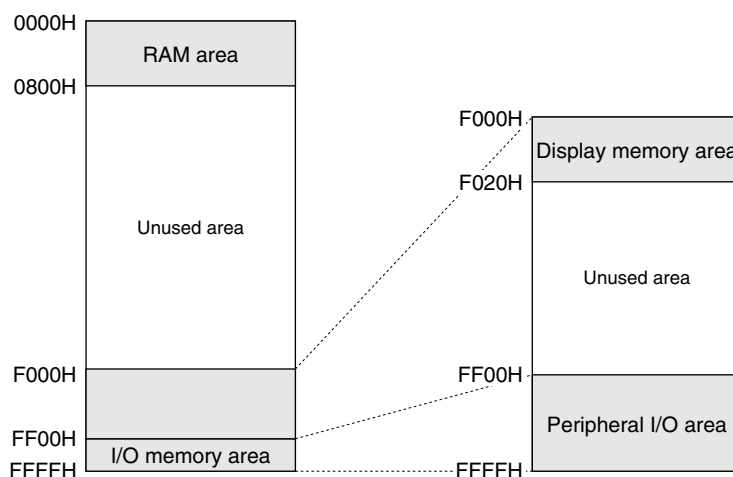

Fig. 4.1.1 Memory map

*Note: Memory is not implemented in unused areas within the memory map. Further, some non-implementation areas and unused (access prohibition) areas exist in the peripheral I/O area. If the program that accesses these areas is generated, its operation cannot be guaranteed. Refer to the I/O memory maps shown in Tables 4.1.1 (a)–(f) for the peripheral I/O area.*

## 4.2 Watchdog Timer

### 4.2.1 Configuration of watchdog timer

The S1C6P366 has a built-in watchdog timer that operates with a 256 Hz divided clock from the OSC1 as the source clock. The watchdog timer starts operating after initial reset, however, it can be stopped by the software. The watchdog timer must be reset cyclically by the software while it operates. If the watchdog timer is not reset in at least 3–4 seconds, it generates a non-maskable interrupt (NMI) to the CPU.

Figure 4.2.1.1 is the block diagram of the watchdog timer.

Fig. 4.2.1.1 Watchdog timer block diagram

The watchdog timer contains a 10-bit binary counter, and generates the non-maskable interrupt when the last stage of the counter (0.25 Hz) overflows.

Watchdog timer reset processing in the program's main routine enables detection of program overrun, such as when the main routine's watchdog timer processing is bypassed. Ordinarily this routine is incorporated where periodic processing takes place, just as for the timer interrupt routine.

The watchdog timer operates in the HALT mode. If a HALT status continues for 3–4 seconds, the non-maskable interrupt releases the HALT status.

### 4.2.2 Interrupt function

If the watchdog timer is not reset periodically, the non-maskable interrupt (NMI) is generated to the core CPU. Since this interrupt cannot be masked, it is accepted even in the interrupt disable status (I flag = "0"). However, it is not accepted when the CPU is in the interrupt mask state until SP1 and SP2 are set as a pair, such as after initial reset or during re-setting the stack pointer. The interrupt vector of NMI is assigned to 0100H in the program memory.

### 4.2.3 I/O memory of watchdog timer

Table 4.2.3.1 shows the I/O address and control bits for the watchdog timer.

Table 4.2.3.1 Control bits of watchdog timer

Address	Register									Comment
	D3	D2	D1	D0	Name	Init *1	1	0		
FF07H	0	0	WDEN	WDRST	0 *3	— *2			Unused	
					0 *3	— *2			Unused	
	R		R/W	W	WDEN	1	Enable	Disable	Watchdog timer enable	
					WDRST*3	Reset	Reset	Invalid	Watchdog timer reset (writing)	

\*1 Initial value at initial reset

\*2 Not set in the circuit

\*3 Constantly "0" when being read

#### WDEN: Watchdog timer enable register (FF07H•D1)

Selects whether the watchdog timer is used (enabled) or not (disabled).

When "1" is written: Enabled

When "0" is written: Disabled

Reading: Valid

When "1" is written to the WDEN register, the watchdog timer starts count operation. When "0" is written, the watchdog timer does not count and does not generate the interrupt (NMI).

At initial reset, this register is set to "1".

#### WDRST: Watchdog timer reset (FF07H•D0)

Resets the watchdog timer.

When "1" is written: Watchdog timer is reset

When "0" is written: No operation

Reading: Always "0"

When "1" is written to WDRST, the watchdog timer is reset and restarts immediately after that. When "0" is written, no operation results.

This bit is dedicated for writing, and is always "0" for reading.

### 4.2.4 Programming notes

- (1) When the watchdog timer is being used, the software must reset it within 3-second cycles.
- (2) Because the watchdog timer is set in operation state by initial reset, set the watchdog timer to disabled state (not used) before generating an interrupt (NMI) if it is not used.

## 4.3 Oscillation Circuit

### 4.3.1 Configuration of oscillation circuit

The S1C6P366 has two oscillation circuits (OSC1 and OSC3). OSC1 is a crystal oscillation circuit that supplies the operating clock to the CPU and peripheral circuits. OSC3 is either a CR or a ceramic oscillation circuit. When processing with the S1C6P366 requires high-speed operation, the CPU operating clock can be switched from OSC1 to OSC3 by the software.

Figure 4.3.1.1 is the block diagram of this oscillation system.

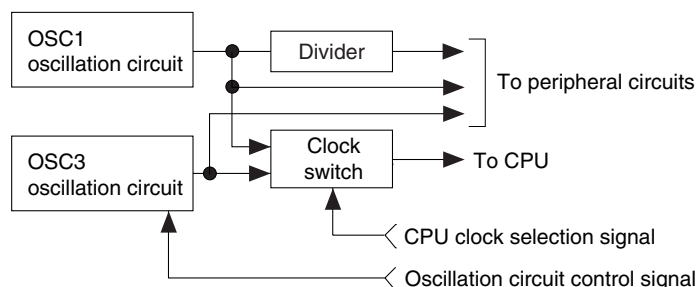

Fig. 4.3.1.1 Oscillation system block diagram

### 4.3.2 OSC1 oscillation circuit

The OSC1 oscillation circuit generates the main clock for the CPU and the peripheral circuits. The oscillator type is a crystal oscillation circuit and the oscillation frequency is 32.768 kHz (Typ.).

Figure 4.3.2.1 is the block diagram of the OSC1 oscillation circuit.

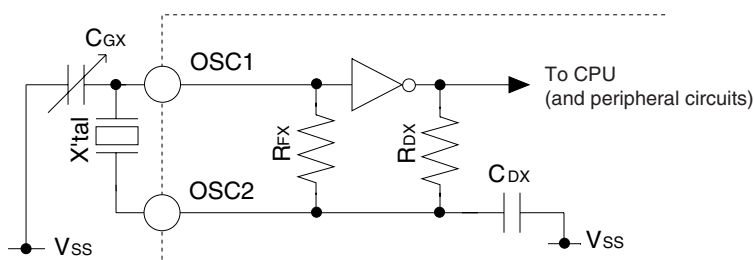

Fig. 4.3.2.1 OSC1 oscillation circuit

As shown in Figure 4.3.2.1, the crystal oscillation circuit can be configured simply by connecting the crystal oscillator (X'tal) of 32.768 kHz (Typ.) between the OSC1 and OSC2 terminals and the trimmer capacitor (CGX) between the OSC1 and Vss terminals.

### 4.3.3 OSC3 oscillation circuit

The S1C6P366 has built-in the OSC3 oscillation circuit that generates the CPU's sub-clock for high speed operation and the source clock for peripheral circuits needing a high speed clock (programmable timer, FOUT output). The mask option enables selection of either the CR (Typ. 1.8 MHz) or ceramic (Max. 4 MHz ceramic oscillation) oscillation circuit. When CR oscillation is selected, only a resistance is required as an external element. When ceramic oscillation is selected, a ceramic oscillator and two capacitors (gate and drain capacitance) are required.

Figure 4.3.3.1 is the block diagram of the OSC3 oscillation circuit.

(a) CR oscillation circuit

(b) Ceramic oscillation circuit

Fig. 4.3.3.1 OSC3 oscillation circuit

As shown in Figure 4.3.3.1, the CR oscillation circuit can be configured simply by connecting the resistor  $R_{CR}$  between the OSC3 and OSC4 terminals when CR oscillation is selected. See Chapter 9, "Electrical Characteristics" for resistance value of  $R_{CR}$ .

When ceramic oscillation is selected, the ceramic oscillation circuit can be configured by connecting the ceramic oscillator (Max. 4 MHz) between the OSC3 and OSC4 terminals, capacitor  $C_{GC}$  between the OSC3 and OSC4 terminals, and capacitor  $C_{DC}$  between the OSC4 and  $V_{SS}$  terminals. For both  $C_{GC}$  and  $C_{DC}$ , connect capacitors that are about 100 pF. To reduce current consumption of the OSC3 oscillation circuit, oscillation can be stopped by the software (OSCC register).

### 4.3.4 Operating voltage

The S1C6P366 generates the  $V_{D1}$  voltage internally for the oscillation circuit in order to stabilize oscillation. In the S1C6P366, the  $V_{D1}$  voltage is used only for the oscillation circuit and the voltage level is fixed at  $2.05 \pm 0.3$  V.

Therefore, setting of the VDC register (FF00H•D0) required in the mask ROM model is invalidated and does not affect the  $V_{D1}$  voltage level.

When using the S1C6P366 as a development tool for the S1C63358/63158, switch the operating voltage using the VDC register according to the control sequence of the model (refer to the "Technical Manual"). Furthermore, internal logic circuits (including the OSC3 oscillation circuit) of the S1C6P366 except for the OSC1 oscillation circuit operate with the source voltage supplied between the VDD and Vss terminal.

### 4.3.5 Switching operating clock

The CPU system clock is switched to OSC1 or OSC3 by the software (CLKCHG register).

When using OSC3 as the CPU system clock, first turn the OSC3 oscillation ON and then switch the clock after waiting 5 msec or more for oscillation stabilization.

When switching from OSC3 to OSC1, turn the OSC3 oscillation circuit OFF after switching the clock.

#### *OSC1 → OSC3*

1. Set OSCC to "1" (OSC3 oscillation ON).
2. Maintain 5 msec or more.
3. Set CLKCHG to "1" (OSC1 → OSC3).

#### *OSC3 → OSC1*

1. Set CLKCHG to "0" (OSC3 → OSC1).
2. Set OSCC to "0" (OSC3 oscillation OFF).

### 4.3.6 Clock frequency and instruction execution time

Table 4.3.6.1 shows the instruction execution time according to each frequency of the system clock.

Table 4.3.6.1 Clock frequency and instruction execution time

Clock frequency	Instruction execution time (μsec)		
	1-cycle instruction	2-cycle instruction	3-cycle instruction
OSC1: 32.768 kHz	61	122	183
OSC3: 4 MHz	0.5	1	1.5

### 4.3.7 I/O memory of oscillation circuit

Table 4.3.7.1 shows the I/O address and the control bits for the oscillation circuit.

Table 4.3.7.1 Control bits of oscillation circuit

Address	Register								Comment
	D3	D2	D1	D0	Name	Init *1	1	0	
FF00H	CLKCHG	OSCC	0	VDC	CLKCHG	0	OSC3	OSC1	CPU clock switch
					OSCC	0	On	Off	OSC3 oscillation On/Off
					0 *3	– *2			Unused
	R/W		R	R/W	VDC	0	(OSC3)	(OSC1)	(Operating voltage switch)

\*1 Initial value at initial reset

\*2 Not set in the circuit

\*3 Constantly "0" when being read

#### VDC: Operating voltage switching register (FF00H•D0)

In the S1C6P366, the value set in this register does not affect the VD1 voltage level. However, note that the register value affects the CLKCHG register that switches the CPU clock.

When using the S1C6P366 as a development tool for the S1C63358/63158, switch the operating voltage using this register according to the control sequence of the model (refer to the "Technical Manual").

At initial reset, this register is set to "0".

#### OSCC: OSC3 oscillation control register (FF00H•D2)

Controls oscillation ON/OFF for the OSC3 oscillation circuit.

When "1" is written: OSC3 oscillation ON

When "0" is written: OSC3 oscillation OFF

Reading: Valid

When it is necessary to operate the CPU at high speed, set OSCC to "1". At other times, set it to "0" to reduce current consumption.

At initial reset, this register is set to "0".

#### CLKCHG: CPU system clock switching register (FF00H•D3)

The CPU's operation clock is selected with this register.

When "1" is written: OSC3 clock is selected

When "0" is written: OSC1 clock is selected

Reading: Valid

When the CPU clock is to be OSC3, set CLKCHG to "1"; for OSC1, set CLKCHG to "0".

After turning the OSC3 oscillation ON (OSCC = "1"), switching of the clock should be done after waiting 5 msec or more.

When VDC = "0" and/or when OSC3 oscillation is OFF (OSCC = "0"), setting of CLKCHG = "1" becomes invalid and switching to OSC3 is not performed.

At initial reset, this register is set to "0".

### 4.3.8 Programming notes

- (1) It takes at least 5 msec from the time the OSC3 oscillation circuit goes ON until the oscillation stabilizes. Consequently, when switching the CPU operation clock from OSC1 to OSC3, do this after a minimum of 5 msec have elapsed since the OSC3 oscillation went ON.  
Further, the oscillation stabilization time varies depending on the external oscillator characteristics and conditions of use, so allow ample margin when setting the wait time.
- (2) When switching the clock from OSC3 to OSC1, use a separate instruction for switching the OSC3 oscillation OFF. An error in the CPU operation can result if this processing is performed at the same time by the one instruction.
- (3) In the S1C6P366, the VDC register value does not affect the V<sub>D1</sub> voltage level. However, note that the CPU clock cannot be switched from OSC1 to OSC3 using the CLKCHG register if the VDC register value is "0".  
When using the S1C6P366 as a development tool for the S1C63358/63158, switch the operating voltage using the VDC register according to the control sequence of the model (refer to the "Technical Manual").

## 4.4 Input Ports (K00–K03, K10–K13 and K20)

### 4.4.1 Configuration of input ports

The S1C6P366 has nine bits of general-purpose input ports. Each of the input port terminals (K00–K03, K10–K13, K20) provides internal pull-up resistor.

Figure 4.4.1.1 shows the configuration of input port (K00–K03, K10–K13).

Figure 4.4.1.2 shows the configuration of input port (K20).

Fig. 4.4.1.1 Configuration of input port (K00–K03, K10–K13)

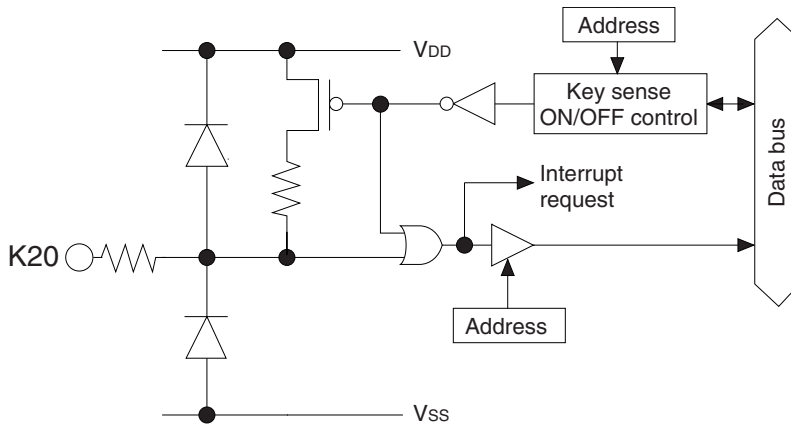

Fig. 4.4.1.2 Configuration of input port (K20)

### 4.4.2 Interrupt function

All nine bits of the input ports (K00–K03, K10–K13, K20) provide the interrupt function. The conditions for issuing an interrupt can be set by the software. Further, whether to mask the interrupt function can be selected by the software. The input interrupts are divided into three systems: K0 (K00–K03), K1 (K10–K13) and K20 systems.

Figure 4.4.2.1 shows the configuration of K00–K03 (K10–K13) interrupt circuit.

Figure 4.4.2.2 shows the configuration of K20 interrupt circuit.

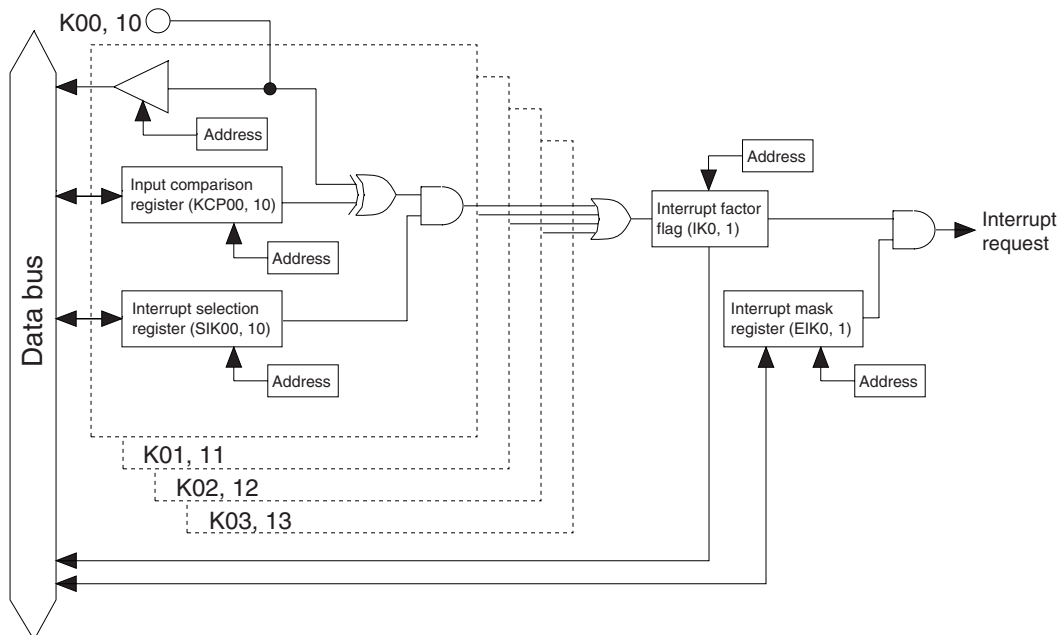

Fig. 4.4.2.1 Input interrupt circuit configuration (K00–K03, K10–K13)

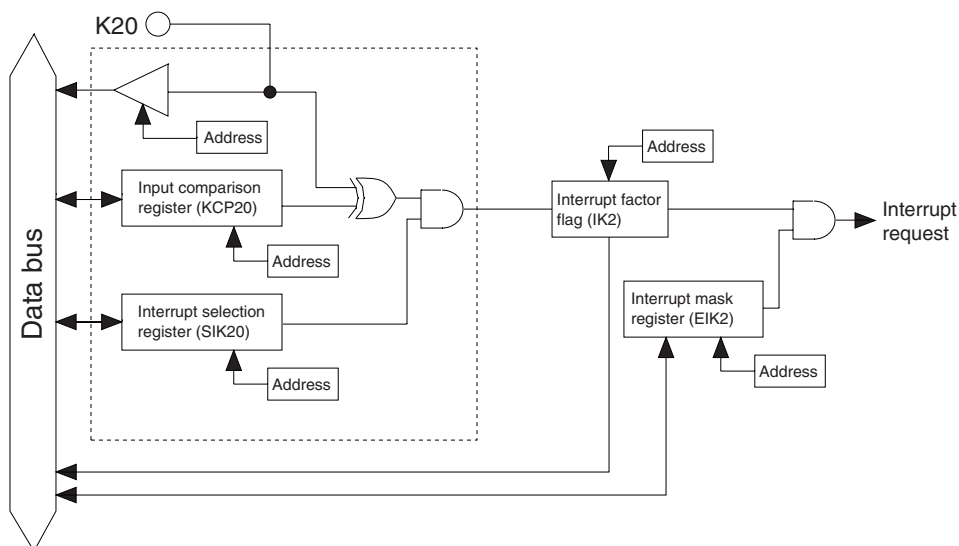

Fig. 4.4.2.2 Input interrupt circuit configuration (K20)

The interrupt selection register (SIK) and input comparison register (KCP) are individually set for the input ports K00–K03, K10–K13 and K20, and can specify the terminals for generating interrupt and interrupt timing.

The interrupt selection registers (SIK00–SIK03, SIK10–SIK13, SIK20) select what input of K00–K03, K10–K13 and K20 to use for the interrupt. Writing "1" into an interrupt selection register incorporates that input port into the interrupt generation conditions. The changing the input port where the interrupt selection register has been set to "0" does not affect the generation of the interrupt.

The input interrupt timing can select that the interrupt be generated at the rising edge of the input or that it be generated at the falling edge according to the set value of the input comparison registers (KCP00–KCP03, KCP10–KCP13, KCP20).

By setting these two conditions, the interrupt for K00–K03, K10–K13 or K20 is generated when input ports in which an interrupt has been enabled by the input selection registers and the contents of the input comparison registers have been changed from matching to no matching.

The interrupt mask registers (EIK0, EIK1, EIK2) enable the interrupt mask to be selected for K00–K03, K10–K13 and K20.

When the interrupt is generated, the interrupt factor flag (IK0, IK1, IK2) is set to "1".

Figure 4.4.2.3 shows an example of an interrupt for K00–K03.

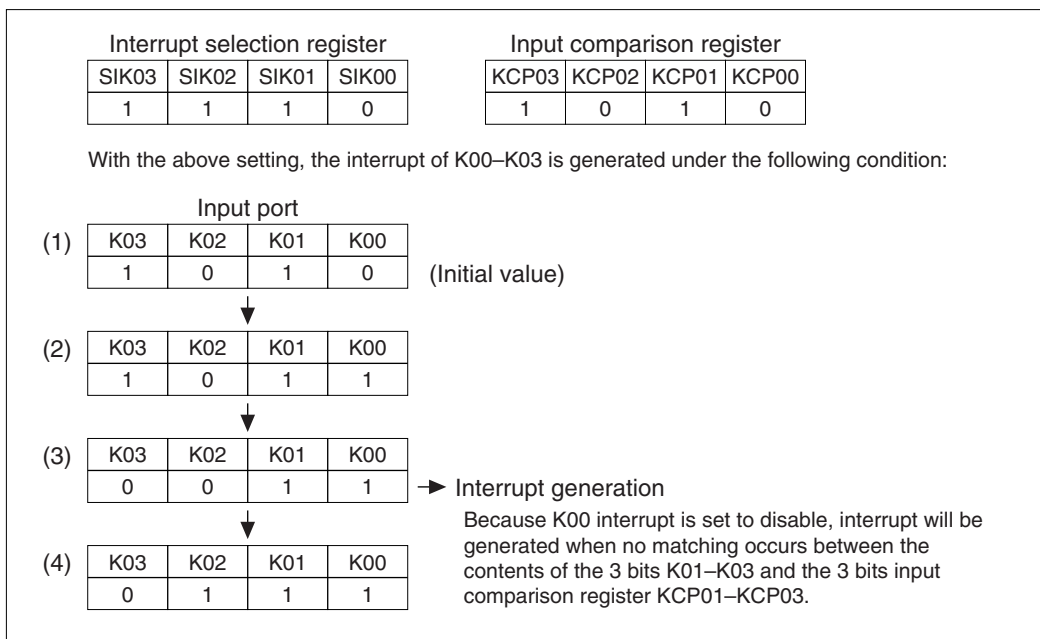

Fig. 4.4.2.3 Example of interrupt of K00–K03

K00 interrupt is disabled by the interrupt selection register (SIK00), so that an interrupt does not occur at (2). At (3), K03 changes to "0"; the data of the terminals that are interrupt enabled no longer match the data of the input comparison registers, so that interrupt occurs. As already explained, the condition for the interrupt to occur is the change in the port data and contents of the input comparison registers from matching to no matching. Hence, in (4), when the no matching status changes to another no matching status, an interrupt does not occur. Further, terminals that have been masked for interrupt do not affect the conditions for interrupt generation.

#### 4.4.3 Mask option

In the S1C6P366, the input port specification is fixed at "Input with pull-up resistor".

### 4.4.4 I/O memory of input ports

Table 4.4.4.1 shows the I/O addresses and the control bits for the input ports.

\*1 Initial value at initial reset

\*2 Not set in the circuit

\*3 Constantly "0" when being read

**K00–K03: K0 port input port data (FF21H)**

**K10–K13: K1 port input port data (FF25H)**

**K20: K20 port input port data (FF29H•D0)**

Input data of the input port terminals can be read with these registers.

When "1" is read: High level

When "0" is read: Low level

Writing: Invalid

The reading is "1" when the terminal voltage of the nine bits of the input ports (K00–K03, K10–K13, K20) goes high (VDD), and "0" when the voltage goes low (Vss).

These bits are dedicated for reading, so writing cannot be done.

**SIK00–SIK03: K0 port interrupt selection register (FF20H)**

**SIK10–SIK13: K1 port interrupt selection register (FF24H)**

**SIK20: K20 port interrupt selection register (FF28H•D0)**

Selects the ports to be used for the K00–K03, K10–K13 and K20 input interrupts.

When "1" is written: Enable

When "0" is written: Disable

Reading: Valid

Enables the interrupt for the input ports (K00–K03, K10–K13, K20) for which "1" has been written into the interrupt selection registers (SIK00–SIK03, SIK10–SIK13, SIK20). The input port set for "0" does not affect the interrupt generation condition.

At initial reset, these registers are set to "0".

**KCP00–KCP03: K0 port input comparison register (FF22H)**

**KCP10–KCP13: K1 port input comparison register (FF26H)**

**KCP20: K20 port input comparison register (FF2AH•D0)**

Interrupt conditions for terminals K00–K03, K10–K13 and K20 can be set with these registers.

When "1" is written: Falling edge

When "0" is written: Rising edge

Reading: Valid

The interrupt conditions can be set for the rising or falling edge of input for each of the nine bits (K00–K03, K10–K13, K20), through the input comparison registers (KCP00–KCP03, KCP10–KCP13, KCP20). For KCP00–KCP03, a comparison is done only with the ports that are enabled by the interrupt among K00–K03 by means of the SIK00–SIK03 registers. For KCP10–KCP13, a comparison is done only with the ports that are enabled by the interrupt among K10–K13 by means of the SIK10–SIK13 registers. For KCP20, a comparison is done only when the K20 port has been enabled by means of the SIK20 register.

At initial reset, these registers are set to "1".

**EIK0: K0 input interrupt mask register (FFE4H•D0)**

**EIK1: K1 input interrupt mask register (FFE5H•D0)**

**EIK2: K20 input interrupt mask register (FFE5H•D1)**

Masking the interrupt of the input port can be selected with these registers.

When "1" is written: Enable

When "0" is written: Mask

Reading: Valid

With these registers, masking of the input port interrupt can be selected for each of the three systems (K00–K03, K10–K13, K20).

At initial reset, these registers are set to "0".

**IK0: K0 input interrupt factor flag (FFF4H•D0)****IK1: K1 input interrupt factor flag (FFF5H•D0)****IK2: K20 input interrupt factor flag (FFF5H•D1)**

These flags indicate the occurrence of input interrupt.

When "1" is read: Interrupt has occurred

When "0" is read: Interrupt has not occurred

When "1" is written: Flag is reset

When "0" is written: Invalid

The interrupt factor flags IK0, IK1 and IK2 are associated with K00–K03, K10–K13 and K20, respectively. From the status of these flags, the software can decide whether an input interrupt has occurred.

The interrupt factor flag is set to "1" when the interrupt condition is established regardless of the interrupt mask register setting. However, the interrupt does not occur to the CPU when the interrupt is masked.

These flags are reset to "0" by writing "1" to them.

After an interrupt occurs, the same interrupt will occur again if the interrupt enabled state (I flag = "1") is set or the RETI instruction is executed unless the interrupt factor flag is reset. Therefore, be sure to reset (write "1" to) the interrupt factor flag in the interrupt service routine before shifting to the interrupt enabled state.

At initial reset, these flags are set to "0".

**SENON: K20 port key sense ON/OFF control (FF2BH•D0)**

Controls the key sense function.

When "1" is written: On

When "0" is written: Off

Reading: Valid

When using K20 as a general purpose input port, fix this register at "1" (On).

When K20 is used for the key sense function, set SENON on during the key sense stage. If any key is pressed (see Figure 4.4.4.1), the K20 port generates an interrupt to the CPU. Then set SENON to off (K20 port key sense OFF), turn the outside N-P-N transistor on using an output port and start the A/D converter. The A/D converter converts the input voltage that varies according to the pressed key into a digital value. The software can discriminate which key was pressed from the conversion result. After that, turn SENON off to reduce current consumption.

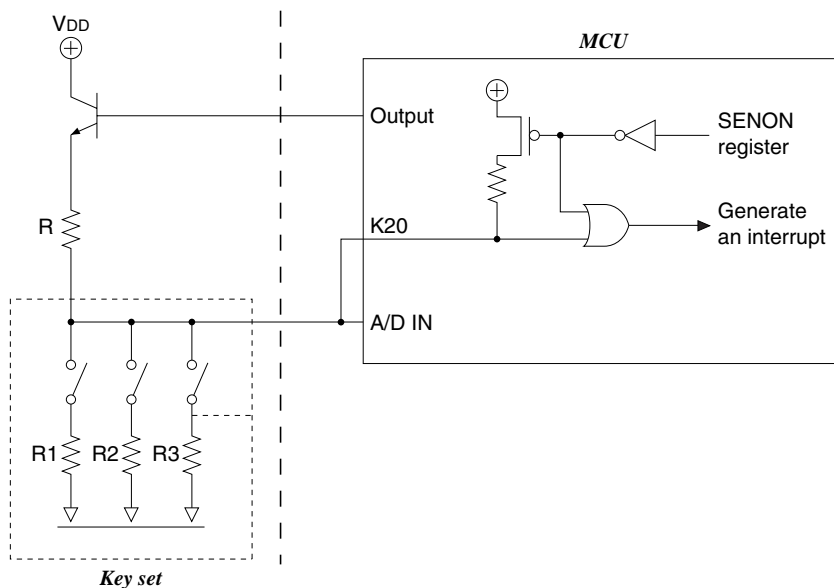

Fig. 4.4.4.1 Key position sensing circuit

This chart is an example of the circuit that discriminates the pressed key with only two wires connected between the MCU chip and the key set. It is useful to reduce the connection wires when the key set location is far from the MCU chip.

**Operation:** The keys are connected to the ground via a resistor that is different from other keys. So each key will generate a different voltage for inputting to the A/D converter.  
Pressing a key generates an interrupt to the MCU. The interrupt turns the transistor on using the output port and starts A/D conversion. The MCU can discriminate the pressed key using the digital value converted by the A/D converter.

#### 4.4.5 Programming notes

- (1) When input ports are changed from low to high by pull-up resistors, the rise of the waveform is delayed on account of the time constant of the pull-up resistor and input gate capacitance. Hence, when fetching input ports, set an appropriate waiting time.  
Particular care needs to be taken of the key scan during key matrix configuration.  
Make this waiting time the amount of time or more calculated by the following expression.  

$$10 \times C \times R$$

C: terminal capacitance 5 pF + parasitic capacitance ? pF  
R: pull-up resistance 300 kΩ
- (2) The K13 terminal functions as the clock input terminal for the programmable timer, and the input signal is shared with the input port and the programmable timer. Therefore, when the K13 terminal is set to the clock input terminal for the programmable timer, take care of the interrupt setting.
- (3) After an interrupt occurs, the same interrupt will occur again if the interrupt enabled state (I flag = "1") is set or the RETI instruction is executed unless the interrupt factor flag is reset. Therefore, be sure to reset (write "1" to) the interrupt factor flag in the interrupt service routine before shifting to the interrupt enabled state.

## 4.5 Output Ports (R00–R03, R10–R13 and R20–R23)

### 4.5.1 Configuration of output ports

The S1C6P366 has 12 bits of general output ports.  
Output specifications of the output ports are fixed at complementary output.  
Figure 4.5.1.1 shows the configuration of the output port.

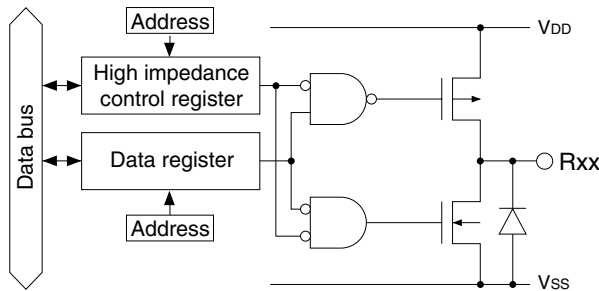

Fig. 4.5.1.1 Configuration of output port

The R02 and R03 output terminals are shared with special output terminals (TOUT, FOUT), and this function is selected by the software.  
At initial reset, these are all set to the general purpose output port.  
Table 4.5.1.1 shows the setting of the output terminals by function selection.

Table 4.5.1.1 Function setting of output terminals

Terminal name	Terminal status at initial reset	Special output	
		TOUT	FOUT
R00	R00 (High output)	R00	R00
R01	R01 (High output)	R01	R01
R02	R02 (High output)	TOUT	
R03	R03 (High output)		FOUT
R10–R13	R10–R13 (High output)	R10–R13	R10–R13
R20–R23	R20–R23 (High output)	R20–R23	R20–R23

When using the output port (R02, R03) as the special output port, the data register must be fixed at "1" and the high impedance control register must be fixed at "0" (data output).

### 4.5.2 Mask option

In the S1C6P366, output specifications of all the output ports are fixed at complementary output.

### 4.5.3 High impedance control

The terminal output status of the output ports can be set to a high impedance status. This control is done using the high impedance control registers.

The high impedance control registers are provided to correspond with the output ports as shown below.

High impedance control register	Corresponding output port
R00HIZ	R00 (1-bit)
R01HIZ	R01 (1-bit)
R02HIZ	R02 (1-bit)
R03HIZ	R03 (1-bit)
R1HIZ	R10–R13 (4-bit)
R2HIZ	R20–R23 (4-bit)

When "1" is written to the high impedance control register, the corresponding output port terminal goes into high impedance status. When "0" is written, the port outputs a signal according to the data register.

### 4.5.4 Special output

In addition to the regular DC output, special output can be selected for the output ports R02 and R03 as shown in Table 4.5.4.1 with the software.

Figure 4.5.4.1 shows the configuration of the R02 and R03 output ports.

Table 4.5.4.1 Special output

Terminal	Special output	Output control register
R03	FOUT	FOUTE
R02	TOUT	PTOUT

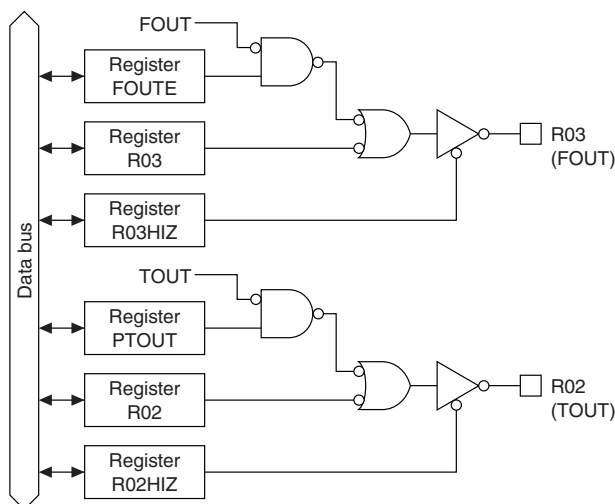

Fig. 4.5.4.1 Configuration of R02 and R03 output ports

At initial reset, the output port data register is set to "1" and the high impedance control register is set to "0". Consequently, the output terminal goes high (VDD).

When using the output port (R02, R03) as the special output port, fix the data register (R02, R03) at "1" and the high impedance control register (R02HIZ, R03HIZ) at "0" (data output). The respective signal should be turned ON and OFF using the special output control register.

- Note:**
- Be aware that the output terminal is fixed at a low (Vss) level the same as the DC output if "0" is written to the R02 and R03 registers when the special output has been selected.
  - Be aware that the output terminal shifts into high impedance status when "1" is written to the high impedance control register (R02HIZ, R03HIZ).

• TOUT (R02)

The R02 terminal can output a TOUT signal.  
The TOUT signal is the clock that is output from the programmable timer, and can be used to provide a clock signal to an external device.  
To output the TOUT signal, fix the R02 register at "1" and the R02HIZ register at "0", and turn the signal ON and OFF using the PTOUT register. It is, however, necessary to control the programmable timer.  
Refer to Section 4.9, "Programmable Timer" for details of the programmable timer.

*Note: A hazard may occur when the TOUT signal is turned ON and OFF.*

Figure 4.5.4.2 shows the output waveform of the TOUT signal.

Fig. 4.5.4.2 Output waveform of TOUT signal

• FOUT (R03)

The R03 terminal can output a FOUT signal.  
The FOUT signal is a clock (fosc1 or fosc3) that is output from the oscillation circuit or a clock that the fosc1 clock has divided in the internal circuit, and can be used to provide a clock signal to an external device.  
To output the FOUT signal, fix the R03 register at "1" and the R03HIZ register at "0", and turn the signal ON and OFF using the FOUTE register.  
The frequency of the output clock may be selected from among 4 types shown in Table 4.5.4.2 by setting the FOFQ0 and FOFQ1 registers.

Table 4.5.4.2 FOUT clock frequency

FOFQ1	FOFQ0	Clock frequency
1	1	fosc3
1	0	fosc1
0	1	fosc1 × 1/8
0	0	fosc1 × 1/64

fosc1: Clock that is output from the OSC1 oscillation circuit  
fosc3: Clock that is output from the OSC3 oscillation circuit

When fosc3 is selected for the FOUT signal frequency, it is necessary to control the OSC3 oscillation circuit before output.  
Refer to Section 4.3, "Oscillation Circuit", for the control and notes.

*Note: A hazard may occur when the FOUT signal is turned ON and OFF.*

Figure 4.5.4.3 shows the output waveform of the FOUT signal.

Fig. 4.5.4.3 Output waveform of FOUT signal

### 4.5.5 I/O memory of output ports

Table 4.5.5.1 shows the I/O addresses and control bits for the output ports.

Table 4.5.5.1 Control bits of output ports

				R/W	CKSEL0	0	OSC3	OSC1	Prescaler 0 source clock selection

\*1 Initial value at initial reset

\*2 Not set in the circuit

\*3 Constantly "0" when being read

**R00HIZ–R03HIZ: R0 port high impedance control register (FF30H)**

**R1HIZ: R1 port high impedance control register (FF32H•D0)**

**R2HIZ: R2 port high impedance control register (FF34H•D0)**

Controls high impedance output of the output port.

When "1" is written: High impedance

When "0" is written: Data output

Reading: Valid

By writing "0" to the high impedance control register, the corresponding output terminal outputs according to the data register. When "1" is written, it shifts into high impedance status.

When the output ports R02 and R03 are used for special output (TOUT, FOUT), fix the R02HIZ register and the R03HIZ register at "0" (data output).

At initial reset, these registers are set to "0".

**R00–R03: R0 output port data register (FF31H)****R10–R13: R1 output port data register (FF33H)****R20–R23: R2 output port data register (FF35H)**

Set the output data for the output ports.

When "1" is written: High level output

When "0" is written: Low level output

Reading: Valid

The output port terminals output the data written in the corresponding data registers without changing it. When "1" is written to the register, the output port terminal goes high (VDD), and when "0" is written, the output port terminal goes low (VSS).

When the output ports R02 and R03 are used for special output (TOUT, FOUT), fix the R02 register and the R03 register at "1".

At initial reset, these registers are all set to "1".

**FOUTE: FOUT output control register (FF06H•D3)**

Controls the FOUT output.

When "1" is written: FOUT output ON

When "0" is written: FOUT output OFF

Reading: Valid

By writing "1" to the FOUTE register when the R03 register has been set to "1" and the R03HIZ register has been set to "0", an FOUT signal is output from the R03 terminal. When "0" is written, the R03 terminal goes high (VDD).

When using the R03 output port for DC output, fix this register at "0".

At initial reset, this register is set to "0".

**FOFQ0, FOFQ1: FOUT frequency selection register (FF06H•D0, D1)**

Selects a frequency of the FOUT signal.

*Table 4.5.5.2 FOUT clock frequency*

FOFQ1	FOFQ0	Clock frequency
1	1	fOSC3
1	0	fOSC1
0	1	fOSC1 × 1/8
0	0	fOSC1 × 1/64

At initial reset, this register is set to "0".

**PTOUT: TOUT output control register (FFC1H•D2)**

Controls the TOUT output.

When "1" is written: TOUT output ON

When "0" is written: TOUT output OFF

Reading: Valid

By writing "1" to the PTOUT register when the R02 register has been set to "1" and the R02HIZ register has been set to "0", the TOUT signal is output from the R02 terminal. When "0" is written, the R02 terminal goes high (VDD).

When using the R02 output port for DC output, fix this register at "0".

At initial reset, this register is set to "0".

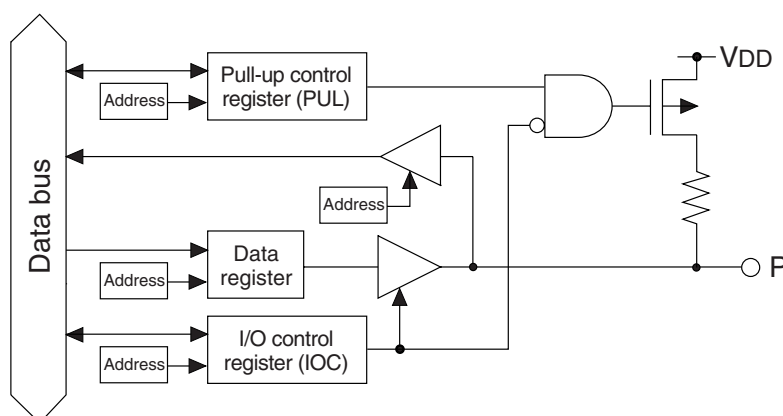

#### 4.5.6 Programming notes

- (1) When using the output port (R02, R03) as the special output port, fix the data register (R02, R03) at "1" and the high impedance control register (R02HIZ, R03HIZ) at "0" (data output).  
Be aware that the output terminal is fixed at a low (Vss) level the same as the DC output if "0" is written to the R02 and R03 registers when the special output has been selected.  
Be aware that the output terminal shifts into high impedance status when "1" is written to the high impedance control register (R02HIZ, R03HIZ).
- (2) A hazard may occur when the FOUT signal and the TOUT signal are turned ON and OFF.
- (3) When fosc3 is selected for the FOUT signal frequency, it is necessary to control the OSC3 oscillation circuit before output.  
Refer to Section 4.3, "Oscillation Circuit", for the control and notes.

## 4.6 I/O Ports (P00–P03, P10–P13, P20–P23, P30–P33 and P40–P43)

### 4.6.1 Configuration of I/O ports

The S1C6P366 has 20 bits general-purpose I/O ports. Figure 4.6.1.1 shows the configuration of the I/O port. The output specification during output mode is fixed at complementary output and the P10–P13, P20–P23 and P30–P33 ports have built-in pull-up resistors.

\* P40–P43 ports do not have a pull-up resistor

Fig. 4.6.1.1 Configuration of I/O port

The P10–P13 I/O port terminals are shared with the serial interface input/output terminals and this function is selected by the software. The P40–P43 I/O port terminals are shared with the A/D converter input terminals and this function is also selected by the software.

At initial reset, these are all set to the I/O port.

Table 4.6.1.1 shows the setting of the input/output terminals by function selection.

Table 4.6.1.1 Function setting of input/output terminals

Terminal name	Terminal status at initial reset	Serial I/F		A/D converter
		Master	Slave	
P00–P03	P00–P03 (Input & pull-up)	P00–P03	P00–P03	P00–P03
P10	P10 (Input & pull-up)	SIN(I)	SIN(I)	
P11	P11 (Input & pull-up)	SOUT(O)	SOUT(O)	
P12	P12 (Input & pull-up)	SCLK(O)	SCLK(I)	
P13	P13 (Input & pull-up)	P13	SRDY(O)	
P20–P23	P20–P23 (Input & pull-up)	P20–P23	P20–P23	P20–P23
P30–P33	P30–P33 (Input & pull-up)	P30–P33	P30–P33	P30–P33
P40	P40 (Input & high impedance)			AD0(I)
P41	P41 (Input & high impedance)			AD1(I)
P42	P42 (Input & high impedance)			AD2(I)
P43	P43 (Input & high impedance)			AD3(I)

When these ports are used as I/O ports, the ports can be set to either input mode or output mode (in 1-bit unit). Modes can be set by writing data to the I/O control registers.

Refer to Section 4.10, "Serial Interface", for control of the serial interface.

Refer to Section 4.11, "A/D Converter", for control of the A/D converter.

### 4.6.2 Mask option

In the S1C6P366, the output specification of all the I/O ports is fixed at "complementary output", and the pull-up option for the P10–P13, P20–P23 and P30–P33 ports is fixed at "with pull-up resistor".

### 4.6.3 I/O control registers and input/output mode

Input or output mode can be set for the I/O ports by writing data into the corresponding I/O control registers IOCxx.

To set the input mode, write "0" to the I/O control register. When an I/O port is set to input mode, it becomes high impedance status and works as an input port.

However, when the pull-up explained in the following section has been set by software, the input line is pulled up only during this input mode (except for P40–P43).

To set the output mode, write "1" to the I/O control register. When an I/O port is set to output mode, it works as an output port, it outputs a high level (VDD) when the port output data is "1", and a low level (Vss) when the port output data is "0".

If perform the read out in each mode; when output mode, the register value is read out, and when input mode, the port value is read out.

At initial reset, the I/O control registers are set to "0", and the I/O ports enter the input mode.

The I/O control registers of the ports that are set as input/output for the serial interface and A/D converter can be used as general purpose registers that do not affect the I/O control. (See Table 4.6.1.1.)

### 4.6.4 Pull-up during input mode

A pull-up resistor that operates during the input mode is built into the I/O ports P10–P13, P20–P23 and P30–P33 of the S1C6P366.

The pull-up resistor becomes effective by writing "1" to the pull-up control register PULxx that corresponds to each port, and the input line is pulled up during the input mode. When "0" has been written, no pull-up is done.

At initial reset, the pull-up control registers are set to "1".

The pull-up control registers of the ports, that are set as input/output for the serial interface, can be used as general purpose registers that do not affect the pull-up control. (See Table 4.6.1.1.)

The pull-up control registers of the port, that are set as input for the serial interface, function the same as the I/O port.

### 4.6.5 I/O memory of I/O ports

Tables 4.6.5.1(a) and (b) show the I/O addresses and the control bits for the I/O ports.

Table 4.6.5.1(a) Control bits of I/O ports (1)

Address	Register								Comment

\*1 Initial value at initial reset

\*2 Not set in the circuit

\*3 Constantly "0" when being read

**ESIF: Serial interface enable register (FF70H•D0)**

Selects function for P10–P13.

When "1" is written: Serial interface input/output port

When "0" is written: I/O port

Reading: Valid

When using the serial interface, write "1" to this register and when P10–P13 are used as the I/O port, write "0". The configuration of the terminals within P10–P13 that are used for the serial interface is decided by the mode selected with the SCS1 and SCS0 registers (see Section 4.10).

In the slave mode, all the P10–P13 ports are set to the serial interface input/output port. In the master mode, P10–P12 are set to the serial interface input/output port and P13 can be used as the I/O port. At initial reset, this register is set to "0".

**PAD0–PAD3: A/D input channel enable/disable control register (FFD1H)**

Selects function for P40–P43.

When "1" is written: A/D converter input

When "0" is written: I/O port

Reading: Valid

When using the A/D converter, write "1" to the register. PAD0–PAD3 correspond to P40–P43, respectively.

When using a port from P40 to P43 as an I/O port, write "0" to the corresponding PAD register.

At initial reset, this register is set to "0".

**P00–P03: P0 I/O port data register (FF42H)****P10–P13: P1 I/O port data register (FF46H)****P20–P23: P2 I/O port data register (FF4AH)****P30–P33: P3 I/O port data register (FF4EH)****P40–P43: P4 I/O port data register (FF52H)**

I/O port data can be read and output data can be set through these registers.

**• When writing data**

When "1" is written: High level

When "0" is written: Low level

When an I/O port is set to the output mode, the written data is output unchanged from the I/O port terminal. When "1" is written as the port data, the port terminal goes high (VDD), and when "0" is written, the terminal goes low (VSS).

Port data can be written also in the input mode.

**• When reading data**

When "1" is read: High level

When "0" is read: Low level

The terminal voltage level of the I/O port is read out. When the I/O port is in the input mode the voltage level being input to the port terminal can be read out; in the output mode the register value can be read.

When the terminal voltage is high (VDD) the port data that can be read is "1", and when the terminal voltage is low (VSS) the data is "0".

When the PUL register is set to "1", the built-in pull-up resistor goes ON during input mode, so that the I/O port terminal is pulled up (except for P40–P43).

The data registers of the ports that are set as input/output for the serial interface or A/D converter can be used as general purpose registers that do not affect the input/output.

*Note: When in the input mode, I/O ports are changed from low to high by pull-up resistor, the rise of the waveform is delayed on account of the time constant of the pull-up resistor and input gate capacitance. Hence, when fetching input ports, set an appropriate wait time.*

*Particular care needs to be taken of the key scan during key matrix configuration.*

*Make this waiting time the amount of time or more calculated by the following expression.*

$$10 \times C \times R$$

*C: terminal capacitance 5 pF + parasitic capacitance ? pF*

*R: pull-up resistance 300 kΩ*

**IOC00–IOC03: P0 port I/O control register (FF40H)**

**IOC10–IOC13: P1 port I/O control register (FF44H)**

**IOC20–IOC23: P2 port I/O control register (FF48H)**

**IOC30–IOC33: P3 port I/O control register (FF4CH)**

**IOC40–IOC43: P4 port I/O control register (FF50H)**

The input and output modes of the I/O ports are set with these registers.

When "1" is written: Output mode

When "0" is written: Input mode

Reading: Valid

The input and output modes of the I/O ports are set in 1-bit unit.

Writing "1" to the I/O control register makes the corresponding I/O port enter the output mode, and writing "0" induces the input mode.

At initial reset, these registers are all set to "0", so the I/O ports are in the input mode.

The I/O control registers of the ports that are set as input/output for the serial interface or A/D converter can be used as general purpose registers that do not affect the input/output.

**PUL00–PUL03: P0 port pull-up control register (FF41H)**

**PUL10–PUL13: P1 port pull-up control register (FF45H)**

**PUL20–PUL23: P2 port pull-up control register (FF49H)**

**PUL30–PUL33: P3 port pull-up control register (FF4DH)**

The pull-up during the input mode are set with these registers.

When "1" is written: Pull-up ON

When "0" is written: Pull-up OFF

Reading: Valid

The built-in pull-up resistor which is turned ON during input mode is set to enable in 1-bit units. (The pull-up resistor is available for the P10–P13, P20–P23, P30–P33 ports.)

By writing "1" to the pull-up control register, the corresponding I/O ports are pulled up (during input mode), while writing "0" turns the pull-up function OFF.

At initial reset, these registers are all set to "1", so the pull-up function is set to ON.

The registers of the ports that are set as input/output for the serial interface or A/D converter can be used as general purpose registers that do not affect the pull-up control.

The pull-up control registers of the port that are set as input for the serial interface function the same as the I/O port.

#### 4.6.6 Programming note

When in the input mode, I/O ports are changed from low to high by pull-up resistor, the rise of the waveform is delayed on account of the time constant of the pull-up resistor and input gate capacitance. Hence, when fetching input ports, set an appropriate wait time.

Particular care needs to be taken of the key scan during key matrix configuration.

Make this waiting time the amount of time or more calculated by the following expression.

$$10 \times C \times R$$

C: terminal capacitance 5 pF + parasitic capacitance ? pF

R: pull-up resistance 300 kΩ

## 4.7 LCD Driver (COM0–COM3, SEG0–SEG31)

### 4.7.1 Configuration of LCD driver

The S1C6P366 has 4 common terminals (COM0–COM3) and 32 segment terminals (SEG0–SEG31), so that it can drive an LCD with a maximum of 128 ( $32 \times 4$ ) segments.

The driving method is 1/4 duty, 1/3 duty or 1/2 duty dynamic drive with four voltages (1/3 bias), VSS, VC1, VC2 and VC3. It is also possible to set static drive. The drive duty and static drive can be selected by software.

### 4.7.2 Power supply for LCD driving

VC1–VC3 are the LCD drive voltages generated by the LCD system voltage circuit.

The LCD system voltage circuit generates VC2 with the voltage regulator incorporated in itself, and generates two other voltages by boosting or reducing the voltage VC2.

The LCD system voltage circuit that generates VC1–VC3 is turned ON and OFF by the LCD power control register LPWR.

By setting LPWR to "1", the LCD system voltage circuit generates VC1–VC3. When LPWR is set to "0", VC1–VC3 becomes VSS level. In this case, all outputs from the COM terminals and SEG terminals go to VSS level.

To display the LCD, the LCD drive power must be ON by previously setting LPWR to "1".

Furthermore, SEG output ports that are set for DC output operate same as the output (R) port regardless of the power ON/OFF control.

### 4.7.3 Control of LCD display and drive waveform

#### (1) Display ON/OFF control

The S1C6P366 incorporates the ALON and ALOFF registers to blink display. When "1" is written to ALON, all the segments go ON, and when "1" is written to ALOFF, all the segments go OFF. At such a time, an ON waveform or an OFF waveform is output from SEG terminals. When "0" is written to these registers, normal display is performed. Furthermore, when "1" is written to both of the ALON and ALOFF, ALON (all ON) has priority over the ALOFF (all OFF).

#### (2) Setting of drive duty

In the S1C6P366, the drive duty can be set to 1/4, 1/3 or 1/2 by the software. This setting is done using the LDUTY1 and LDUTY0 registers as shown in Table 4.7.3.1.

Table 4.7.3.1 LCD drive duty setting

LDUTY1	LDUTY0	Drive duty	Common terminal used	Maximum segment number	Frame frequency *
1	*	1/2	COM0, COM1	64 ( $32 \times 2$ )	32 Hz
0	1	1/3	COM0–COM2	96 ( $32 \times 3$ )	42.7 Hz
0	0	1/4	COM0–COM3	128 ( $32 \times 4$ )	32 Hz

\* When fosc1 = 32.768 kHz

Figures 4.7.3.1 to 4.7.3.3 show the dynamic drive waveform according to the drive duty.

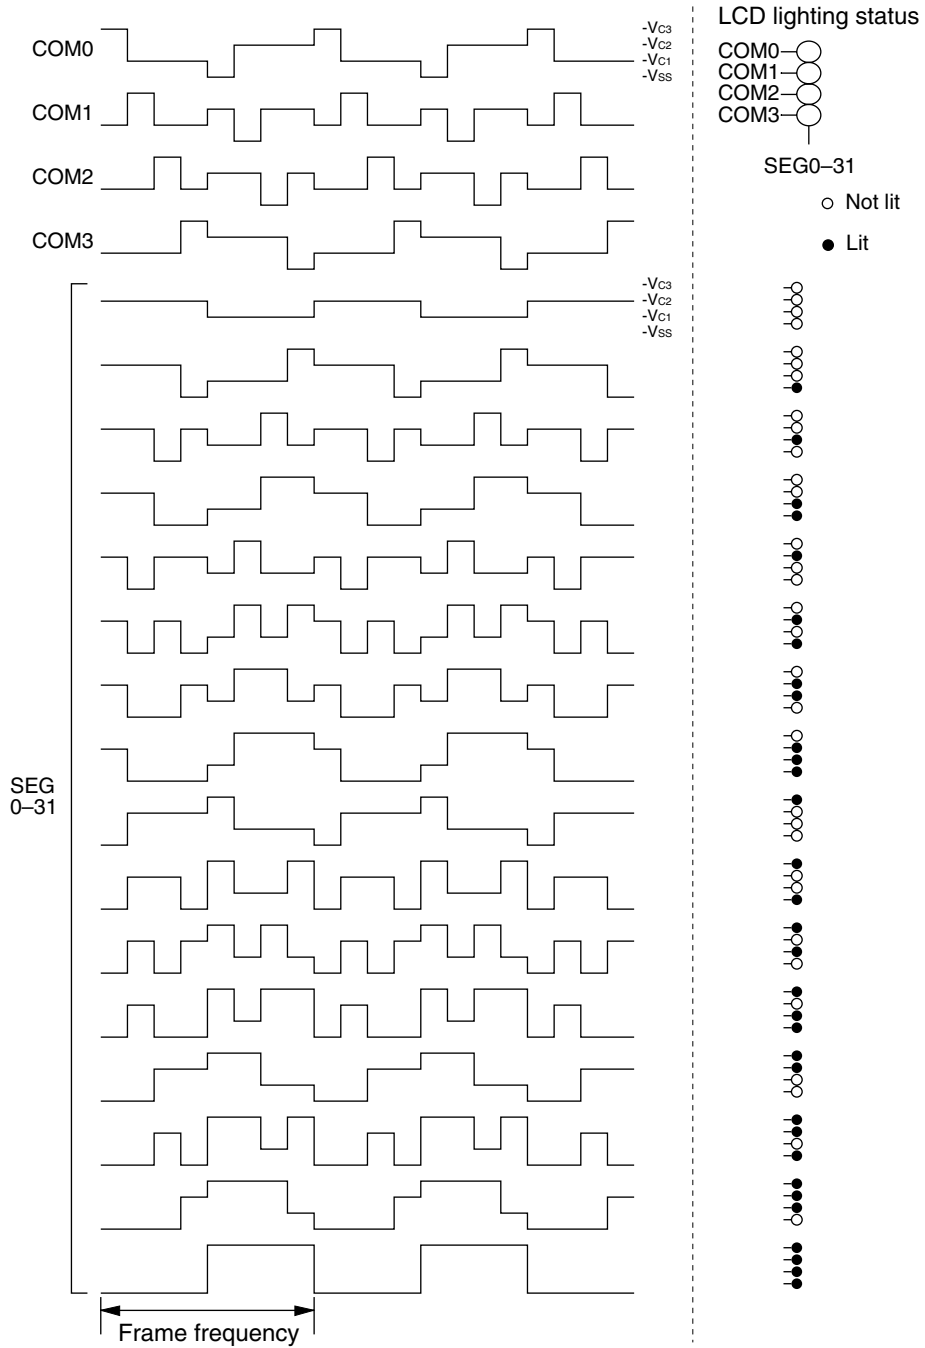

Fig. 4.7.3.1 Dynamic drive waveform for 1/4 duty (1/3 bias)

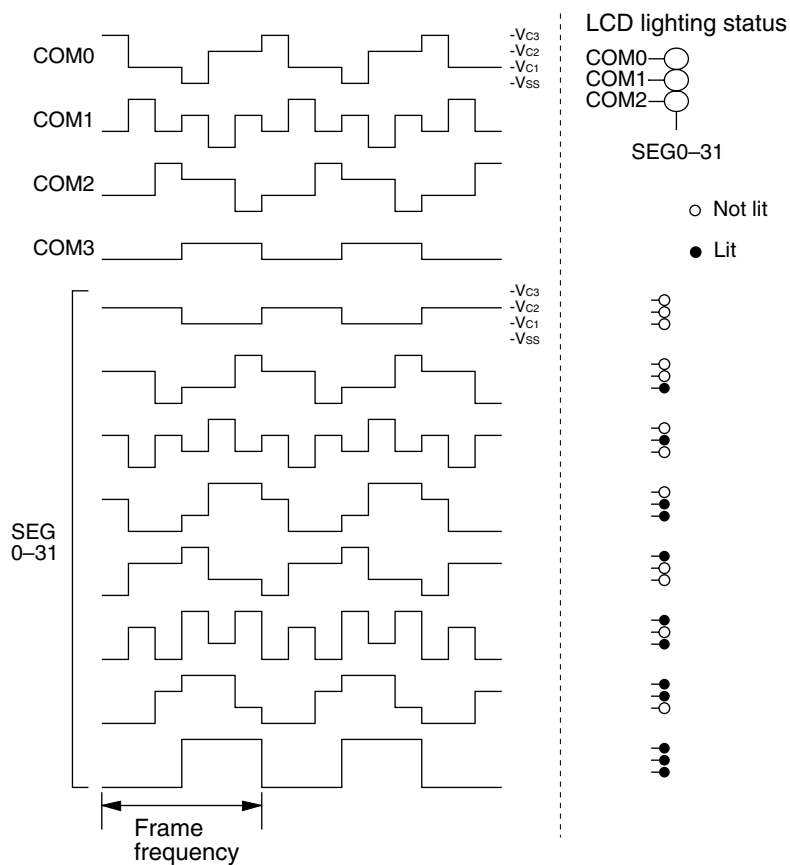

Fig. 4.7.3.2 Dynamic drive waveform for 1/3 duty (1/3 bias)

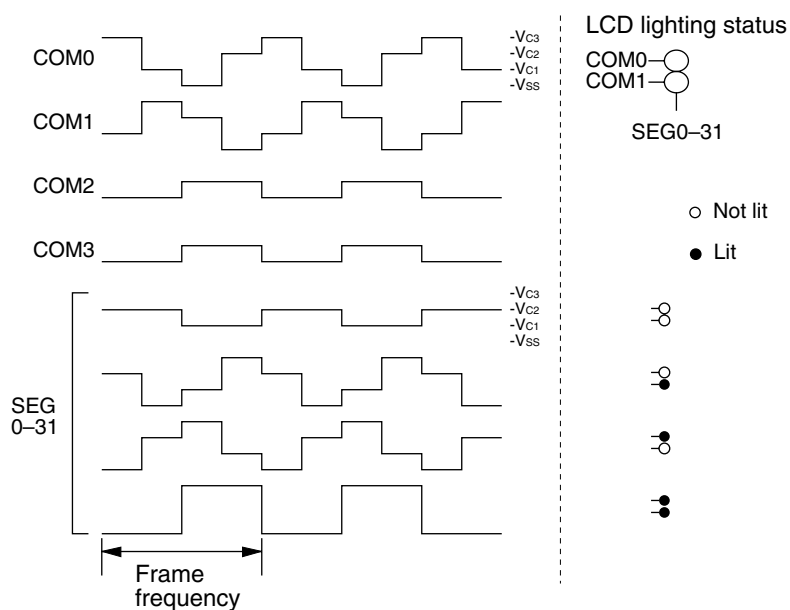

Fig. 4.7.3.3 Dynamic drive waveform for 1/2 duty (1/3 bias)

### (3) Static drive

The S1C6P366 provides software setting of the LCD static drive.

To set in static drive, write "1" to the common output signal control register STCD. Then, by writing "1" to any one of COM0 to COM3 (display memory) corresponding to the SEG terminal, the SEG terminal outputs a static ON waveform. When all the COM0 to COM3 bits are set to "0", the SEG terminal outputs a dynamic OFF waveform.

Figure 4.7.3.4 shows the static drive waveform.

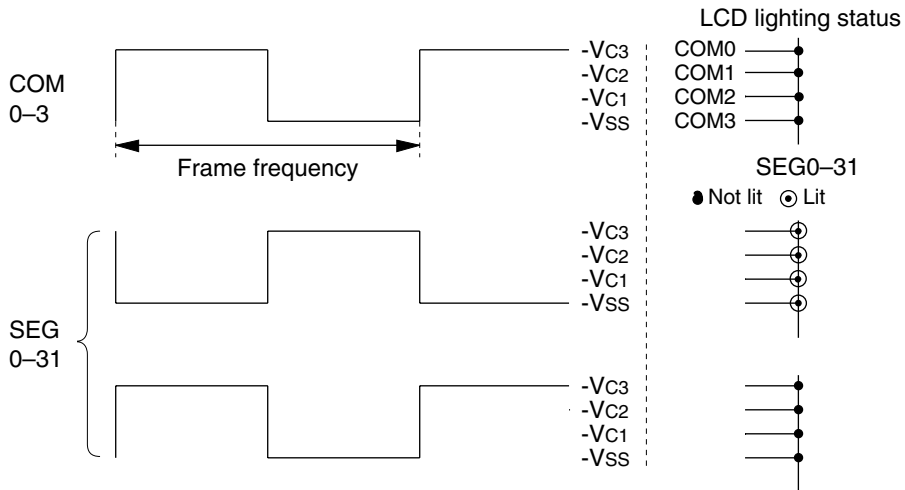

Fig. 4.7.3.4 Static drive waveform (1/3 bias)

### 4.7.4 Segment option

#### (1) Segment allocation

Up to 128 bits of the display memory can be selected from the data memory addresses F000H to F01FH.

The LCD driver has a segment decoder built-in, and the data bit (D0–D3) of the optional address in the display memory area (F000H–F01FH) can be allocated to the optional segment. This makes design easy by increasing the degree of freedom with which the liquid crystal panel can be designed.

The allocated segment displays when the bit for the display memory is set to "1", and goes out when bit is set to "0".

Figure 4.7.4.1 shows an example of the relationship between the LCD segments (on the panel) and the display memory for the case of 1/3 duty.

Fig. 4.7.4.1 Segment allocation

At initial reset, the contents of the display memory are undefined, therefore it is necessary to initialize by software. Since the display memory permits reading and writing, the addresses/bits that are not used on the LCD display can be used as general-purpose registers.

#### (2) Output specification

- ① The segment terminals (SEG0–SEG31) can be selected in pairs\* for either segment signal output or DC output (VDD and VSS binary output).  
When DC output is selected, the data corresponding to COM0 of each segment terminal is output.
- ② When DC output is selected, either complementary output or N-channel open drain output can be selected for each terminal.

\* The terminal pairs are combination of  $\text{SEG}2 \times n$  and  $\text{SEG}2 \times n + 1$  (where  $n$  is an integer from 0 to 15).

### (3) Segment option

Recommended LCD segment option data is include in the S5U1C6P366Y1 package. Modifying the LCD segment option is done at the user's own risk.

The output specification data for the LCD segment terminals and data for LCD segment assignment to the display memory are generated by converting the segment option document file output from the SOG63358 segment option generator.

By writing the option data to the segment option PROM, the segment terminals are automatically configured with the selected optional specifications.

### 4.7.5 Mask option

The S1C6P366 generates the LCD drive voltage using the internal power supply circuit and does not allow use of an external power source.

### 4.7.6 I/O memory of LCD driver

Table 4.7.6.1 shows the I/O addresses and the control bits for the LCD driver. Figure 4.7.6.1 shows the display memory map.

Table 4.7.6.1 Control bits of LCD driver

Address	Register								Comment
	D3	D2	D1	D0	Name	Init *1	1	0	
FF60H	LDUTY1	LDUTY0	VCCHG	LPWR	LDUTY1	0			<input type="checkbox"/> LCD drive duty switch [LDUTY1, 0] 0 1 2, 3 Duty 1/4 1/3 1/2
					LDUTY0	0

					ALON	0	All On	Normal	LCD all ON control
	R	R/W			STCD	0	Static	Dynamic	Common output signal control

\*1 Initial value at initial reset

\*2 Not set in the circuit

\*3 Constantly "0" when being read

Base address	Low	0	1	2	3	4	5	6	7	8	9	A	B	C	D	E	F
	F000	Display memory (32 words × 4 bits) R/W															
F010																	

Fig. 4.7.6.1 Display memory map

#### LPWR: LCD power control (ON/OFF) register (FF60H•D0)

Turns the LCD system voltage circuit ON and OFF.

When "1" is written: ON

When "0" is written: OFF

Reading: Valid

When "1" is written to the LPWR register, the LCD system voltage circuit goes ON and generates the LCD drive voltage. When "0" is written, all the LCD drive voltages go to Vss level.

It takes about 100 msec for the LCD drive voltage to stabilize after starting up the LCD system voltage circuit by writing "1" to the LPWR register.

This control does not affect to SEG terminals that have been set for DC output.

At initial reset, this register is set to "0".

#### LDUTY0, LDUTY1: LCD drive duty switching register (FF60H•D2, D3)

Selects the LCD drive duty.

Table 4.7.6.2 Drive duty setting

LDUTY1	LDUTY0	Drive duty	Common terminal used	Maximum segment number	Frame frequency *
1	*	1/2	COM0, COM1	64 (32 × 2)	32 Hz
0	1	1/3	COM0–COM2	96 (32 × 3)	42.7 Hz
0	0	1/4	COM0–COM3	128 (32 × 4)	32 Hz

\* When fosc1 = 32.768 kHz

At initial reset, this register is set to "0".

**STCD: Common output signal control register (FF61H•D0)**

Switches the LCD driving method.

When "1" is written: Static drive

When "0" is written: Dynamic drive

Reading: Valid

By writing "1" to STCD, static drive is selected, and dynamic drive is selected when "0" is written.

At initial reset, this register is set to "0".

**ALON: LCD all ON control register (FF61H•D1)**

Displays the all LCD segments ON.

When "1" is written: All LCD segments displayed

When "0" is written: Normal display

Reading: Valid

By writing "1" to the ALON register, all the LCD segments goes ON, and when "0" is written, it returns to normal display.

This function outputs an ON waveform to the SEG terminals, and segments not affect the content of the display memory.

ALON has priority over ALOFF.

At initial reset, this register is set to "0".

**ALOFF: LCD all OFF control register (FF61H•D2)**

Fade outs the all LCD segments.

When "1" is written: All LCD segments fade out

When "0" is written: Normal display

Reading: Valid

By writing "1" to the ALOFF register, all the LCD segments goes OFF, and when "0" is written, it returns to normal display.

This function outputs an OFF waveform to the SEG terminals, and does not affect the content of the display memory.

At initial reset, this register is set to "1".

**Display memory (F000H–F01FH)**

The LCD segments are lit or turned off depending on this data.

When "1" is written: Lit

When "0" is written: Not lit

Reading: Invalid

By writing data into the display memory allocated to the LCD segment (on the panel), the segment can be lit or put out.

At initial reset, the contents of the display memory are undefined, therefore it is necessary to initialize by software. Since the display memory permits reading and writing, the addresses/bits that are not used on the LCD display can be used as general-purpose registers.

**4.7.7 Programming notes**

- (1) The contents of the display memory are undefined until the area is initialized (through, for instance, memory clear processing by the CPU). Initialize the display memory by executing initial processing.
- (2) 100 msec or more time is necessary for stabilizing the LCD drive voltages VC1, VC2 and VC3 after setting the LCD power control register LPWR to "1". Be careful of the segment-on right after the power is turned on.

## 4.8 Clock Timer

### 4.8.1 Configuration of clock timer

The S1C6P366 has a built-in clock timer that uses OSC1 (crystal oscillator) as the source oscillator. The clock timer is configured of an 8-bit binary counter that serves as the input clock, fOSC1 divided clock output from the prescaler. Timer data (128–16 Hz and 8–1 Hz) can be read out by the software.

Figure 4.8.1.1 is the block diagram for the clock timer.

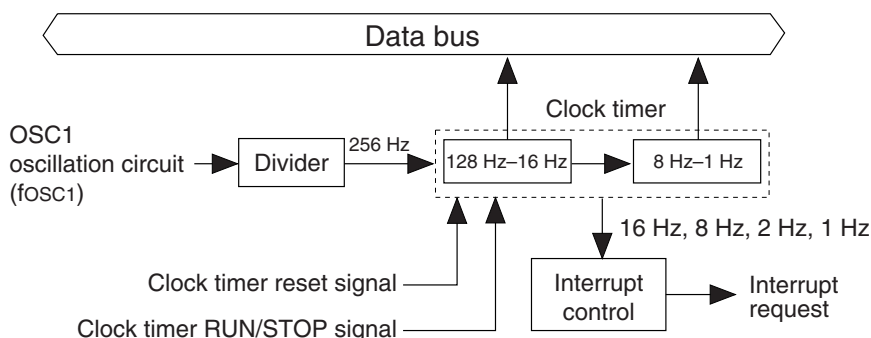

Fig. 4.8.1.1 Block diagram for the clock timer

Ordinarily, this clock timer is used for all types of timing functions such as clocks.

### 4.8.2 Data reading and hold function

The 8 bits timer data are allocated to the address FF79H and FF7AH.

<FF79H>	D0: TM0 = 128 Hz	D1: TM1 = 64 Hz	D2: TM2 = 32 Hz	D3: TM3 = 16 Hz
<FF7AH>	D0: TM4 = 8 Hz	D1: TM5 = 4 Hz	D2: TM6 = 2 Hz	D3: TM7 = 1 Hz

Since the clock timer data has been allocated to two addresses, a carry is generated from the low-order data within the count (TM0–TM3: 128–16 Hz) to the high-order data (TM4–TM7: 8–1 Hz). When this carry is generated between the reading of the low-order data and the high-order data, a content combining the two does not become the correct value (the low-order data is read as FFH and the high-order data becomes the value that is counted up 1 from that point).

The high-order data hold function in the S1C6P366 is designed to operate to avoid this. This function temporarily stops the counting up of the high-order data (by carry from the low-order data) at the point where the low-order data has been read and consequently the time during which the high-order data is held is the shorter of the two indicated here following.

1. Period until it reads the high-order data.
2. 0.48–1.5 msec (Varies due to the read timing.)

*Note:* Since the low-order data is not held when the high-order data has previously been read, the low-order data should be read first.

### 4.8.3 Interrupt function

The clock timer can cause interrupts at the falling edge of 16 Hz, 8 Hz, 2 Hz and 1 Hz signals. Software can set whether to mask any of these frequencies.

Figure 4.8.3.1 is the timing chart of the clock timer.

Fig. 4.8.3.1 Timing chart of clock timer

As shown in Figure 4.8.3.1, interrupt is generated at the falling edge of the frequencies (16 Hz, 8 Hz, 2 Hz, 1 Hz). At this time, the corresponding interrupt factor flag (IT0, IT1, IT2, IT3) is set to "1". Selection of whether to mask the separate interrupts can be made with the interrupt mask registers (EIT0, EIT1, EIT2, EIT3). However, regardless of the interrupt mask register setting, the interrupt factor flag is set to "1" at the falling edge of the corresponding signal.

### 4.8.4 I/O memory of clock timer

Table 4.8.4.1 shows the I/O addresses and the control bits for the clock timer.

Table 4.8.4.1 Control bits of clock timer

Address	Register								Comment
	D3	D2	D1	D0	Name	Init *1	1	0	
FF78H	0	0	TMRST	TMRUN	0 *3	— *2			Unused
					0 *3	— *2			Unused
					TMRST*3	Reset	Reset	Invalid	Clock timer reset (writing)
					TMRUN	0	Run	Stop	Clock timer Run/Stop
FF79H	TM3	TM2	TM1	TM0	TM3	0			Clock timer data (16 Hz)
					TM2	0			Clock timer data (32 Hz)
					TM1	0			Clock timer data (64 Hz)
					TM0	0			Clock timer data (128 Hz)
FF7AH	TM7	TM6	TM5	TM4	TM7	0			Clock timer data (1 Hz)
					TM6	0			Clock timer data (2 Hz)
					TM5	0			Clock timer data (4 Hz)
					TM4	0			Clock timer data (8 Hz)
FFE6H	EIT3	EIT2	EIT1	EIT0	EIT3	0	Enable	Mask	Interrupt mask register (Clock timer 1 Hz)
					EIT2	0	Enable	Mask	Interrupt mask register (Clock timer 2 Hz)
					EIT1	0	Enable	Mask	Interrupt mask register (Clock timer 8 Hz)
					EIT0	0	Enable	Mask	Interrupt mask register (Clock timer 16 Hz)
FFF6H	IT3	IT2	IT1	IT0	IT3	0	(R)	(R)	Interrupt factor flag (Clock timer 1 Hz)
					IT2	0	Yes	No	Interrupt factor flag (Clock timer 2 Hz)
					IT1	0	(W)	(W)	Interrupt factor flag (Clock timer 8 Hz)
					IT0	0	Reset	Invalid	Interrupt factor flag (Clock timer 16 Hz)

\*1 Initial value at initial reset

\*2 Not set in the circuit

\*3 Constantly "0" when being read

#### TM0–TM7: Timer data (FF79H, FF7AH)

The 128–1 Hz timer data of the clock timer can be read out with these registers. These eight bits are read only, and writing operations are invalid.

By reading the low-order data (FF79H), the high-order data (FF7AH) is held until reading or for 0.48–1.5 msec (one of shorter of them).

At initial reset, the timer data is initialized to "00H".

#### TMRST: Clock timer reset (FF78H•D1)

This bit resets the clock timer.

When "1" is written: Clock timer reset

When "0" is written: No operation

Reading: Always "0"

The clock timer is reset by writing "1" to TMRST. When the clock timer is reset in the RUN status, operation restarts immediately. Also, in the STOP status the reset data is maintained. No operation results when "0" is written to TMRST.

This bit is write-only, and so is always "0" at reading.

#### TMRUN: Clock timer RUN/STOP control register (FF78H•D0)

Controls RUN/STOP of the clock timer.

When "1" is written: RUN

When "0" is written: STOP

Reading: Valid

The clock timer enters the RUN status when "1" is written to the TMRUN register, and the STOP status when "0" is written. In the STOP status, the timer data is maintained until the next RUN status or the timer is reset. Also, when the STOP status changes to the RUN status, the data that is maintained can be used for resuming the count.

At initial reset, this register is set to "0".

**EIT0: 16 Hz interrupt mask register (FFE6H•D0)**

**EIT1: 8 Hz interrupt mask register (FFE6H•D1)**

**EIT2: 2 Hz interrupt mask register (FFE6H•D2)**

**EIT3: 1 Hz interrupt mask register (FFE6H•D3)**

These registers are used to select whether to mask the clock timer interrupt.

When "1" is written: Enabled

When "0" is written: Masked

Reading: Valid

The interrupt mask registers (EIT0, EIT1, EIT2, EIT3) are used to select whether to mask the interrupt to the separate frequencies (16 Hz, 8 Hz, 2 Hz, 1 Hz).

At initial reset, these registers are set to "0".

**IT0: 16 Hz interrupt factor flag (FFF6H•D0)**

**IT1: 8 Hz interrupt factor flag (FFF6H•D1)**

**IT2: 2 Hz interrupt factor flag (FFF6H•D2)**

**IT3: 1 Hz interrupt factor flag (FFF6H•D3)**

These flags indicate the status of the clock timer interrupt.

When "1" is read: Interrupt has occurred

When "0" is read: Interrupt has not occurred

When "1" is written: Flag is reset

When "0" is written: Invalid

The interrupt factor flags (IT0, IT1, IT2, IT3) correspond to the clock timer interrupts of the respective frequencies (16 Hz, 8 Hz, 2 Hz, 1 Hz). The software can judge from these flags whether there is a clock timer interrupt. However, even if the interrupt is masked, the flags are set to "1" at the falling edge of the signal.

These flags are reset to "0" by writing "1" to them.

After an interrupt occurs, the same interrupt will occur again if the interrupt enabled state (I flag = "1") is set or the RETI instruction is executed unless the interrupt factor flag is reset. Therefore, be sure to reset (write "1" to) the interrupt factor flag in the interrupt service routine before shifting to the interrupt enabled state.

At initial reset, these flags are set to "0".

#### **4.8.5 Programming notes**

- (1) Be sure to read timer data in the order of low-order data (TM0–TM3) then high-order data (TM4–TM7).
- (2) After an interrupt occurs, the same interrupt will occur again if the interrupt enabled state (I flag = "1") is set or the RETI instruction is executed unless the interrupt factor flag is reset. Therefore, be sure to reset (write "1" to) the interrupt factor flag in the interrupt service routine before shifting to the interrupt enabled state.

## 4.9 Programmable Timer

### 4.9.1 Configuration of programmable timer

The S1C6P366 has two 8-bit programmable timer systems (timer 0 and timer 1) built-in.

Timer 0 and timer 1 are composed of 8-bit presetable down counters and they can be used as 8-bit  $\times$  2 channel programmable timers or a 16-bit  $\times$  1 channel programmable timer by software setting. Timer 0 also has an event counter function using the K13 input port terminal.

Figure 4.9.1.1 shows the configuration of the programmable timer.

The programmable timer is designed to count down from the initial value set in the counter with software. An underflow according to the initial value occurs by counting down and is used for the following functions:

- Presetting the initial value to the counter to generate the periodical underflow signal
- Generating an interrupt
- Generating a TOUT signal output from the R02 output port terminal
- Generating the synchronous clock source for the serial interface (timer 1 underflow is used, and it is possible to set the transfer rate)

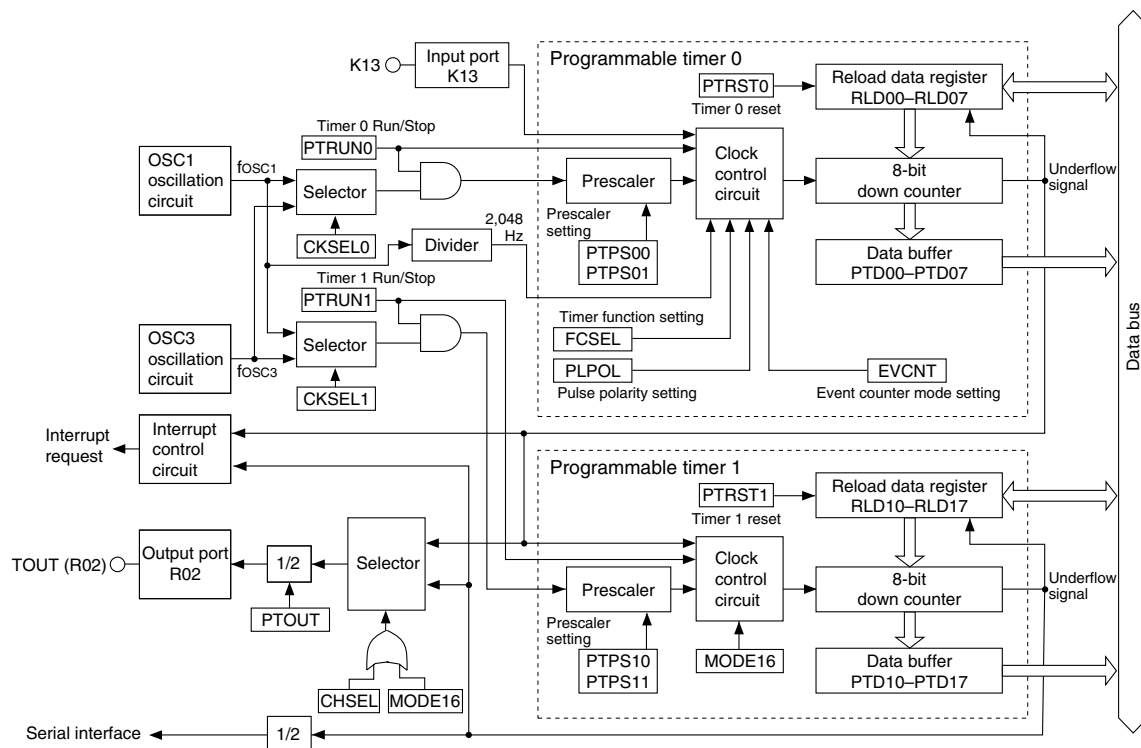

Fig. 4.9.1.1 Configuration of programmable timer

## 4.9.2 Two separate 8-bit timer (MODE16 = "0") operation

### 4.9.2.1 Setting of initial value and counting down

Timers 0 and 1 each have a down counter and reload data register.

The reload data registers RLD00–RLD07 (timer 0) and RLD10–RLD17 (timer 1) are used to set the initial value to the down counter.

By writing "1" to the timer reset bit PTRST0 (timer 0) or PTRST1 (timer 1), the down counter loads the initial value set in the reload register RLD. Therefore, down-counting is executed from the stored initial value by the input clock.

The registers PTRUN0 (timer 0) and PTRUN1 (timer 1) are provided to control the RUN/STOP for timers 0 and 1. By writing "1" to the register after presetting the reload data to the down counter, the down counter starts counting down. Writing "0" stops the input count clock and the down counter stops counting. This control (RUN/STOP) does not affect the counter data. The counter maintains its data while stopped, and can restart counting continuing from that data.

The counter data can be read via the data buffers PTD00–PTD07 (timer 0) and PTD10–PTD17 (timer 1) in optional timing. However, the counter has the data hold function the same as the clock timer, that holds the high-order data when the low-order data is read in order to prevent the borrowing operation between low- and high-order reading, therefore be sure to read the low-order data first.

The counter reloads the initial value set in the reload data register RLD when an underflow occurs through the count down. It continues counting down from the initial value after reloading.

In addition to reloading the counter, this underflow signal controls the interrupt generation, pulse (TOUT signal) output and clock supplying to the serial interface.

Fig. 4.9.2.1.1 Basic operation timing of down counter

### 4.9.2.2 Counter mode

The programmable timer can operate in two counter modes, timer mode and event counter mode. It can be selected by software.

#### (1) Timer mode

The timer mode counts down using the prescaler output as an input clock. In this mode, the programmable timer operates as a periodical timer using the OSC1 or OSC3 oscillation clock as a clock source. Timer 0 can operate in both the timer mode and the event counter mode. The mode can be switched using the timer 0 counter mode selection register EVCNT. When the EVCNT register is set to "0", timer 0 operates in the timer mode.

Timer 1 operates only in the timer mode.

At initial reset, this mode is set.

Refer to Section 4.9.2.1, "Setting of initial value and counting down" for basic operation and control.

The input clock in the timer mode is generated by the prescaler built into the programmable timer. The prescaler generates the input clock by dividing the OSC1 or OSC3 oscillation clock. Refer to the next section for setting the input clock.

#### (2) Event counter mode

The timer 0 has an event counter function that counts an external clock input to the input port K13. This function is selected by writing "1" to the timer 0 counter mode selection register EVCNT. The timer 1 operates only in the timer mode, and cannot be used as an event counter.

In the event counter mode, the clock is supplied to timer 0 from outside of the IC, therefore, the settings of the timer 0 prescaler division ratio selection registers PTPS00 and PTPS01 and the settings of the timer 0 source clock selection register CKSEL0 become invalid.

Count down timing can be selected from either the falling or rising edge of the input clock using the timer 0 pulse polarity selection register PLPOL. When "0" is written to the PLPOL register, the falling edge is selected, and when "1" is written, the rising edge is selected. The count down timing is shown in Figure 4.9.2.2.1.

Fig. 4.9.2.2.1 Timing chart in event counter mode

The event counter mode also includes a noise reject function to eliminate noise such as chattering on the external clock (K13 input signal). This function is selected by writing "1" to the timer 0 function selection register FCSEL.

When "with noise rejector" is selected, an input pulse width for both low and high levels must be 0.98 msec or more to count reliably. (The noise rejecter allows the counter to input the clock at the second falling edge of the internal 2,048 Hz signal after changing the input level of the K13 input port terminal. Consequently, the pulse width of noise that can reliably be rejected is 0.48 msec or less.)

Figure 4.9.2.2.2 shows the count down timing with noise rejecter.

Fig. 4.9.2.2.2 Count down timing with noise rejecter

The operation of the event counter mode is the same as the timer mode except it uses the K13 input as the clock.

Refer to Section 4.9.2.1, "Setting of initial value and counting down" for basic operation and control.

### 4.9.2.3 Setting of input clock in timer mode

Timer 0 and timer 1 each include a prescaler. The prescalers generate the input clock for each timer by dividing the source clock supplied from the OSC1 or OSC3 oscillation circuit.

The source clock (OSC1 or OSC3) and the division ratio of the prescaler can be selected with software for timer 0 and timer 1 individually.

The set input clock is used for the count clock during operation in the timer mode. When the timer 0 is used in the event counter mode, the following settings become invalid.

The input clock is set in the following sequence.

#### (1) Selection of source clock

Select the source clock input to each prescaler from either OSC1 or OSC3. This selection is done using the source clock selection registers CKSEL0 (timer 0) and CKSEL1 (timer 1); when "0" is written to the register, OSC1 is selected and when "1" is written, OSC3 is selected.

When the OSC3 oscillation clock is selected for the clock source, it is necessary to turn the OSC3 oscillation ON, prior to using the programmable timer. However the OSC3 oscillation circuit requires a time interval of several msec to several 10 msec from turning the circuit ON until the oscillation stabilizes. Therefore, allow an adequate interval from turning the OSC3 oscillation circuit ON to starting the programmable timer. Refer to Section 4.3, "Oscillation Circuit", for the control and notes of the OSC3 oscillation circuit.

At initial reset, the OSC3 oscillation circuit is set in the OFF state.

#### (2) Selection of prescaler division ratio

Select the division ratio for each prescaler from among 4 types. This selection is done using the prescaler division ratio selection registers PTPS00/PTPS01 (timer 0) and PTPS10/PTPS11 (timer 1).

Table 4.9.2.3.1 shows the correspondence between the setting value and the division ratio.

Table 4.9.2.3.1 Selection of prescaler division ratio

PTPS11 PTPS01	PTPS10 PTPS00	Prescaler division ratio
1	1	Source clock / 256
1	0	Source clock / 32
0	1	Source clock / 4
0	0	Source clock / 1

By writing "1" to the register PTRUN0 (timer 0) or PTRUN1 (timer 1), the prescaler inputs the source clock and outputs the clock divided by the selected division ratio. The counter starts counting down by inputting the clock.

#### 4.9.2.4 Interrupt function

The programmable timer can generate an interrupt due to an underflow of the timer 0 and timer 1. See Figure 4.9.2.1.1 for the interrupt timing.

An underflow of timer 0 and timer 1 sets the corresponding interrupt factor flag IPT0 (timer 0) or IPT1 (timer 1) to "1", and generates an interrupt. The interrupt can also be masked by setting the corresponding interrupt mask register EIPT0 (timer 0) or EIPT1 (timer 1). However, the interrupt factor flag is set to "1" by an underflow of the corresponding timer regardless of the interrupt mask register setting.

#### 4.9.2.5 Setting of TOUT output

The programmable timer can generate a TOUT signal due to an underflow of timer 0 or timer 1. The TOUT signal is generated by dividing the underflows in 1/2. It is possible to select which timer's underflow is to be used by the TOUT output channel selection register CHSEL. When "0" is written to the CHSEL register, timer 0 is selected and when "1" is written, timer 1 is selected.

Figure 4.9.2.5.1 shows the TOUT signal waveform when the channel is changed.

Fig. 4.9.2.5.1 TOUT signal waveform at channel change

The TOUT signal can be output from the R02 output port terminal. Programmable clocks can be supplied to external devices.

Figure 4.9.2.5.2 shows the configuration of the output port R02.

Fig. 4.9.2.5.2 Configuration of R02

The output of a TOUT signal is controlled by the PTOUT register. When "1" is written to the PTOUT register, the TOUT signal is output from the R02 output port terminal and when "0" is written, the terminal goes to a high (VDD) level. However, the data register R02 must always be "1" and the high impedance control register R02HIZ must always be "0" (data output state).

Since the TOUT signal is generated asynchronously from the PTOUT register, a hazard within 1/2 cycle is generated when the signal is turned ON and OFF by setting the register.

Figure 4.9.2.5.3 shows the output waveform of the TOUT signal.

Fig. 4.9.2.5.3 Output waveform of the TOUT signal

### 4.9.2.6 Transfer rate setting for serial interface

The signal that is made from underflows of timer 1 by dividing them in 1/2, can be used as the clock source for the serial interface.

The programmable timer outputs the clock to the serial interface by setting timer 1 into RUN state (PTRUN1 = "1"). It is not necessary to control with the PTOUT register.

Fig. 4.9.2.6.1 Synchronous clock of serial interface

A setting value for the RLD1X register according to a transfer rate is calculated by the following expression:

$$\text{RLD1X} = \text{fosc} / (2 * \text{bps} * \text{division ratio of the prescaler}) - 1$$

fosc: Oscillation frequency (OSC1/OSC3)

bps: Transfer rate

(00H can be set to RLD1X)

### 4.9.3 One channel × 16-bit timer (MODE16 = "1") operation

Timer 0 and timer 1 are chained together to form 16-bit down counter low byte in timer 0, high byte in timer 1.

#### 4.9.3.1 Setting of initial value and counting down

Timers 0 and 1 each have a down counter and reload data register.

The reload data registers RLD00–RLD07 (timer 0) and RLD10–RLD17 (timer 1) are used to set the initial value to the down counter.

By writing "1" to the timer reset bit PTRST0 (timer 0) or PTRST1 (timer 1), the down counter loads the initial value set in the reload register RLD. Therefore, down-counting is executed from the stored initial value by the input clock.

The register PTRUN0 (timer 0) is used to control the RUN/STOP for timers 0 and 1. By writing "1" to the register after presetting the reload data to the down counter, the down counter starts counting down. Writing "0" stops the input count clock and the down counter stops counting. This control (RUN/STOP) does not affect the counter data. The counter maintains its data while stopped, and can restart counting continuing from that data.

The counter data can be read via the data buffers PTD00–PTD07 (timer 0) and PTD10–PTD17 (timer 1) in optional timing. However, the counter has the data hold function the same as the clock timer, that holds the high-order data when the low-order data is read in order to prevent the borrowing operation between low- and high-order reading, therefore be sure to read the low-order data first.

The counter reloads the initial value set in the reload data register RLD when an underflow occurs through the count down. It continues counting down from the initial value after reloading.

In addition to reloading the counter, this underflow signal controls the interrupt generation, pulse (TOUT signal) output and clock supplying to the serial interface.

### 4.9.3.2 Counter mode

The programmable timer can operate in two counter modes, timer mode and event counter mode. It can be selected by software.

#### (1) Timer mode

The timer mode counts down using the prescaler output as an input clock. In this mode, the programmable timer operates as a periodical timer using the OSC1 or OSC3 oscillation clock as a clock source. The programmable timer can operate in both the timer mode and the event counter mode. The mode can be switched using the timer 0 counter mode selection register EVCNT. When the EVCNT register is set to "0", the programmable timer operates in the timer mode.

At initial reset, this mode is set.

Refer to Section 4.9.3.1, "Setting of initial value and counting down" for basic operation and control.

The input clock in the timer mode is generated by the prescaler built into the programmable timer. The prescaler generates the input clock by dividing the OSC1 or OSC3 oscillation clock. Refer to the next section for setting the input clock.

#### (2) Event counter mode

The programmable timer has an event counter function that counts an external clock input to the input port K13. This function is selected by writing "1" to the timer 0 counter mode selection register EVCNT.

In the event counter mode, the clock is supplied to timer 0 from outside of the IC, therefore, the settings of the timer 0 prescaler division ratio selection registers PTPS00 and PTPS01 and the settings of the timer 0 source clock selection register CKSEL0 become invalid.

Count down timing can be selected from either the falling or rising edge of the input clock using the timer 0 pulse polarity selection register PLPOL. When "0" is written to the PLPOL register, the falling edge is selected, and when "1" is written, the rising edge is selected. The count down timing is shown in Figure 4.9.3.2.1.

Fig. 4.9.3.2.1 Timing chart in event counter mode

The event counter mode also includes a noise reject function to eliminate noise such as chattering on the external clock (K13 input signal). This function is selected by writing "1" to the timer 0 function selection register FCSEL.

When "with noise rejector" is selected, an input pulse width for both low and high levels must be 0.98 msec or more to count reliably. (The noise rejecter allows the counter to input the clock at the second falling edge of the internal 2,048 Hz signal after changing the input level of the K13 input port terminal. Consequently, the pulse width of noise that can reliably be rejected is 0.48 msec or less.)

Figure 4.9.3.2.2 shows the count down timing with noise rejecter.

Fig. 4.9.3.2.2 Count down timing with noise rejecter

The operation of the event counter mode is the same as the timer mode except it uses the K13 input as the clock.

Refer to Section 4.9.3.1, "Setting of initial value and counting down" for basic operation and control.

### 4.9.3.3 Setting of input clock in timer mode

The 16 bit programmable timer include a prescaler. The prescalers generate the input clock for this programmable timer by dividing the source clock supplied from the OSC1 or OSC3 oscillation circuit. The source clock (OSC1 or OSC3) and the division ratio of the prescaler can be selected with software. The set input clock is used for the count clock during operation in the timer mode. When the 16 bit programmable timer is used in the event counter mode, the following settings become invalid.

The input clock is set in the following sequence.

#### (1) Selection of source clock

Select the source clock input to the prescaler from either OSC1 or OSC3. This selection is done using the source clock selection register CKSEL0 (timer 0); when "0" is written to the register, OSC1 is selected and when "1" is written, OSC3 is selected.

When the OSC3 oscillation clock is selected for the clock source, it is necessary to turn the OSC3 oscillation ON, prior to using the programmable timer. However the OSC3 oscillation circuit requires a time interval of at least 5 msec from turning the circuit ON until the oscillation stabilizes. Therefore, allow an adequate interval from turning the OSC3 oscillation circuit ON to starting the programmable timer. Refer to Section 4.3, "Oscillation Circuit", for the control and notes of the OSC3 oscillation circuit.

At initial reset, the OSC3 oscillation circuit is set in the OFF state.

#### (2) Selection of prescaler division ratio

Select the division ratio for the prescaler from among 4 types. This selection is done using the prescaler division ratio selection registers PTPS00/PTPS01 (timer 0). Table 4.9.3.3.1 shows the correspondence between the setting value and the division ratio.

Table 4.9.3.3.1 Selection of prescaler division ratio

PTPS01	PTPS00	Prescaler division ratio
1	1	Source clock / 256
1	0	Source clock / 32
0	1	Source clock / 4
0	0	Source clock / 1

By writing "1" to the register PTRUN0 (timer 0), the prescaler inputs the source clock and outputs the clock divided by the selected division ratio. The counter starts counting down by inputting the clock.

#### 4.9.3.4 Interrupt function

The programmable timer can generate an interrupt due to an underflow.

An underflow of this 16 bit programmable timer sets the corresponding interrupt factor flag IPT1 (timer 1) to "1", and generates an interrupt. The interrupt can also be masked by setting the corresponding interrupt mask register EIPT1 (timer 1). However, the interrupt factor flag is set to "1" by an underflow of the corresponding timer regardless of the interrupt mask register setting.

#### 4.9.3.5 Setting of TOUT output

The programmable timer can generate a TOUT signal due to an underflow of this 16 bit programmable timer. The TOUT signal is generated by dividing the underflows in  $1/2$ .

The TOUT signal can be output from the R02 output port terminal. Programmable clocks can be supplied to external devices.

Figure 4.9.3.5.1 shows the configuration of the output port R02.

Fig. 4.9.3.5.1 Configuration of R02

The output of a TOUT signal is controlled by the PTOUT register. When "1" is written to the PTOUT register, the TOUT signal is output from the R02 output port terminal and when "0" is written, the terminal goes to a high ( $V_{DD}$ ) level. However, the data register R02 must always be "1" and the high impedance control register R02HIZ must always be "0" (data output state).

Since the TOUT signal is generated asynchronously from the PTOUT register, a hazard within  $1/2$  cycle is generated when the signal is turned ON and OFF by setting the register.

Figure 4.9.3.5.2 shows the output waveform of the TOUT signal.

Fig. 4.9.3.5.2 Output waveform of the TOUT signal

#### 4.9.3.6 Transfer rate setting for serial interface

The signal that is made from underflows of the 16 bit programmable timer by dividing them in 1/2, can be used as the clock source for the serial interface.

The programmable timer outputs the clock to the serial interface by setting this 16 bit programmable timer into RUN state (PTRUN0 = "1"). It is not necessary to control with the PTOUT register.

Fig. 4.9.3.6.1 Synchronous clock of serial interface

A setting value for the RLD1X register according to a transfer rate is calculated by the following expression:

$$\text{RLD1X, RLD0X} = \text{fosc} / (2 * \text{bps} * \text{division ratio of the prescaler}) - 1$$

fosc: Oscillation frequency (OSC1/OSC3)

bps: Transfer rate

(00H can be set to RLD1X)

### 4.9.4 I/O memory of programmable timer

Table 4.9.4.1 shows the I/O addresses and the control bits for the programmable timer.

Table 4.9.4.1 Control bits of programmable timer

Address	Register								Comment
	D3	D2	D1	D0	Name	Init *1	1	0

\*1 Initial value at initial reset

\*2 Not set in the circuit

\*3 Constantly "0" when being read

**CKSEL0: Prescaler 0 source clock selection register (FFC1H•D0)****CKSEL1: Prescaler 1 source clock selection register (FFC1H•D1)**

Selects the source clock of the prescaler.

When "1" is written: OSC3 clock

When "0" is written: OSC1 clock

Reading: Valid

The source clock for the prescaler is selected from OSC1 or OSC3. When "0" is written to the CKSEL0 register, the OSC1 clock is selected as the input clock for the prescaler 0 (for timer 0) and when "1" is written, the OSC3 clock is selected.

Same as above, the source clock for prescaler 1 is selected by the CKSEL1 register.

When the event counter mode is selected to timer 0, the setting of the CKSEL0 register becomes invalid.

At initial reset, these registers are set to "0".

**PTPS00, PTPS01: Timer 0 prescaler division ratio selection register (FFC2H•D2, D3)****PTPS10, PTPS11: Timer 1 prescaler division ratio selection register (FFC3H•D2, D3)**

Selects the division ratio of the prescaler.

Two bits of PTPS00 and PTPS01 are the prescaler division ratio selection register for timer 0, and two bits of PTPS10 and PTPS11 are for timer 1. The prescaler division ratios that can be set by these registers are shown in Table 4.9.4.2.

Table 4.9.4.2 Selection of prescaler division ratio

PTPS11 PTPS01	PTPS10 PTPS00	Prescaler division ratio
1	1	Source clock / 256
1	0	Source clock / 32
0	1	Source clock / 4
0	0	Source clock / 1

When the event counter mode is selected to timer 0, the setting of the PTPS00 and PTPS01 becomes invalid.

At initial reset, these registers are set to "0".

**EVCNT: Timer 0 counter mode selection register (FFC0H•D2)**

Selects a counter mode for timer 0.

When "1" is written: Event counter mode

When "0" is written: Timer mode

Reading: Valid

The counter mode for timer 0 is selected from either the event counter mode or timer mode. When "1" is written to the EVCNT register, the event counter mode is selected and when "0" is written, the timer mode is selected.

At initial reset, this register is set to "0".

**MODE16: 8-bit × 2 or 16-bit × 1 timer mode selection register (FFC0H•D3)**

Selects 8-bit × 2 channels mode (timer 0 and timer 1) or 16-bit × 1 channel mode.

When "1" is written: 16-bit × 1 channel

When "0" is written: 8-bit × 2 channels (timer 0 and timer 1)

Reading: Valid

When 8-bit × 2 channels is selected, timer 0 and timer 1 can be used independently.

When 16-bit × 1 channel is selected, timer 0 and timer 1 are chained together and are used as a 16-bit programmable timer. The clock is input to timer 0 and interrupts will be generated from timer 1.

At initial reset, this register is set to "0".

### **FCSEL: Timer 0 function selection register (FFC0H•D1)**

Selects whether the noise rejector of the clock input circuit will be used or not in the event counter mode.

When "1" is written: With noise rejector

When "0" is written: Without noise rejector

Reading: Valid

When "1" is written to the FCSEL register, the noise rejector is used and counting is done by an external clock (K13) with 0.98 msec or more pulse width. (The noise rejector allows the counter to input the clock at the second falling edge of the internal 2,048 Hz signal after changing the input level of the K13 input port terminal. Consequently, the pulse width of noise that can reliably be rejected is 0.48 msec or less.)

When "0" is written to the FCSEL register, the noise rejector is not used and the counting is done directly by an external clock input to the K13 input port terminal.

Setting of this register is effective only when timer 0 is used in the event counter mode.

At initial reset, this register is set to "0".

### **PLPOL: Timer 0 pulse polarity selection register (FFC0H•D0)**

Selects the count pulse polarity in the event counter mode.

When "1" is written: Rising edge

When "0" is written: Falling edge

Reading: Valid

The count timing in the event counter mode (timer 0) is selected from either the falling edge of the external clock input to the K13 input port terminal or the rising edge. When "0" is written to the PLPOL register, the falling edge is selected and when "1" is written, the rising edge is selected.

Setting of this register is effective only when timer 0 is used in the event counter mode.

At initial reset, this register is set to "0".

### **RLD00–RLD07: Timer 0 reload data register (FFC4H, FFC5H)**

### **RLD10–RLD17: Timer 1 reload data register (FFC6H, FFC7H)**

Sets the initial value for the counter.

The reload data written in this register is loaded to the respective counters. The counter counts down using the data as the initial value for counting.

Reload data is loaded to the counter when the counter is reset by writing "1" to the PTRST0 or PTRST1 register, or when counter underflow occurs.

At initial reset, these registers are set to "00H".

### **PTD00–PTD07: Timer 0 counter data (FFC8H, FFC9H)**

### **PTD10–PTD17: Timer 1 counter data (FFCAH, FFCBH)**

Count data in the programmable timer can be read from these latches.

The low-order 4 bits of the count data in timer 0 can be read from PTD00–PTD03, and the high-order data can be read from PTD04–PTD07. Similarly, for timer 1, the low-order 4 bits can be read from PTD10–PTD13, and the high-order data can be read from PTD14–PTD17.

Since the high-order 4 bits are held by reading the low-order 4 bits, be sure to read the low-order 4 bits first.

Since these latches are exclusively for reading, the writing operation is invalid.

At initial reset, these counter data are set to "00H".

**PTRST0: Timer 0 reset (reload) (FFC2H•D1)****PTRST1: Timer 1 reset (reload) (FFC3H•D1)**

Resets the timer and presets reload data to the counter.

When "1" is written: Reset

When "0" is written: No operation

Reading: Always "0"

By writing "1" to PTRST0, the reload data in the reload register PLD00–PLD07 is preset to the counter in timer 0. Similarly, the reload data in PLD10–PLD17 is preset to the counter in timer 1 by PTRST1.

When the counter is preset in the RUN status, the counter restarts immediately after presetting. In the case of STOP status, the reload data is preset to the counter and is maintained.

No operation results when "0" is written.

Since these bits are exclusively for writing, always set to "0" during reading.

**PTRUN0: Timer 0 RUN/STOP control register (FFC2H•D0)****PTRUN1: Timer 1 RUN/STOP control register (FFC3H•D0)**

Controls the RUN/STOP of the counter.

When "1" is written: RUN

When "0" is written: STOP

Reading: Valid

The counter in timer 0 starts counting down by writing "1" to the PTRUN0 register and stops by writing "0".

In STOP status, the counter data is maintained until the counter is reset or is set in the next RUN status. When STOP status changes to RUN status, the data that has been maintained can be used for resuming the count.

Same as above, the timer 1 counter is controlled by the PTRUN1 register.

At initial reset, these registers are set to "0".

**CHSEL: TOUT output channel selection register (FFC1H•D3)**

Selects the channel used for TOUT signal output.

When "1" is written: Timer 1

When "0" is written: Timer 0

Reading: Valid

This register selects which timer's underflow (timer 0 or timer 1) is used to generate a TOUT signal. When "0" is written to the CHSEL register, timer 0 is selected and when "1" is written, timer 1 is selected. In the 16-bit × 2 channels mode (MODE16 = "1"), timer 1 is always selected regardless of this register setting.

At initial reset, this register is set to "0".

**PTOUT: TOUT output control register (FFC1H•D2)**

Turns TOUT signal output ON and OFF.

When "1" is written: ON

When "0" is written: OFF

Reading: Valid

PTOUT is the output control register for the TOUT signal. When "1" is written to the register, the TOUT signal is output from the output port terminal R02 and when "0" is written, the terminal goes to a high (VDD) level. However, the data register R02 must always be "1" and the high impedance control register R02HIZ must always be "0" (data output state).

At initial reset, this register is set to "0".

**EIPT0: Timer 0 interrupt mask register (FFE2H•D0)**

**EIPT1: Timer 1 interrupt mask register (FFE2H•D1)**

These registers are used to select whether to mask the programmable timer interrupt or not.

When "1" is written: Enabled

When "0" is written: Masked

Reading: Valid

Timer 0 and timer 1 interrupts can be masked individually by the interrupt mask registers EIPT0 (timer 0) and EIPT1 (timer 1).

At initial reset, these registers are set to "0".

**IPT0: Timer 0 interrupt factor flag (FFF2H•D0)**

**IPT1: Timer 1 interrupt factor flag (FFF2H•D1)**

These flags indicate the status of the programmable timer interrupt.

When "1" is read: Interrupt has occurred

When "0" is read: Interrupt has not occurred

When "1" is written: Flag is reset

When "0" is written: Invalid

The interrupt factor flags IPT0 and IPT1 correspond to timer 0 and timer 1 interrupts, respectively. The software can judge from these flags whether there is a programmable timer interrupt. However, even if the interrupt is masked, the flags are set to "1" by the underflows of the corresponding counters.

These flags are reset to "0" by writing "1" to them.

After an interrupt occurs, the same interrupt will occur again if the interrupt enabled state (I flag = "1") is set or the RETI instruction is executed unless the interrupt factor flag is reset. Therefore, be sure to reset (write "1" to) the interrupt factor flag in the interrupt service routine before shifting to the interrupt enabled state.

At initial reset, these flags are set to "0".

### 4.9.5 Programming notes

- (1) When reading counter data, be sure to read the low-order 4 bits (PTD00–PTD03, PTD10–PTD13) first. Furthermore, the high-order 4 bits (PTD04–PTD07, PTD14–PTD17) should be read within 0.73 msec of reading the low-order 4 bits (PTD00–PTD03, PTD10–PTD13).

For the 16 bit × 1 mode, be sure to read as following sequence:

(PTD00–PTD03) → (PTD04–PTD07) → (PTD10–PTD13) → (PTD14–PTD17)

The read sequence time should be within 1.46 msec.

- (2) The programmable timer actually enters RUN/STOP status in synchronization with the falling edge of the input clock after writing to the PTRUN0/PTRUN1 register. Consequently, when "0" is written to the PTRUN0/PTRUN1 register, the timer enters STOP status at the point where the counter is decremented (-1). The PTRUN0/PTRUN1 register maintains "1" for reading until the timer actually stops.

Figure 4.9.5.1 shows the timing chart for the RUN/STOP control.

Fig. 4.9.5.1 Timing chart for RUN/STOP control

It is the same even in the event counter mode. Therefore, be aware that the counter does not enter RUN/STOP status if a clock is not input after setting the RUN/STOP control register (PTRUN0).

- (3) Since the TOUT signal is generated asynchronously from the PTOUT register, a hazard within 1/2 cycle is generated when the signal is turned ON and OFF by setting the register.
- (4) When the OSC3 oscillation clock is selected for the clock source, it is necessary to turn the OSC3 oscillation ON, prior to using the programmable timer. However the OSC3 oscillation circuit requires a time interval of at least 5 msec from turning the circuit ON until the oscillation stabilizes. Therefore, allow an adequate interval from turning the OSC3 oscillation circuit ON to starting the programmable timer. Refer to Section 4.3, "Oscillation Circuit", for the control and notes of the OSC3 oscillation circuit.
- At initial reset, the OSC3 oscillation circuit is set in the OFF state.
- (5) After an interrupt occurs, the same interrupt will occur again if the interrupt enabled state (I flag = "1") is set or the RETI instruction is executed unless the interrupt factor flag is reset. Therefore, be sure to reset (write "1" to) the interrupt factor flag in the interrupt service routine before shifting to the interrupt enabled state.
- (6) For the reason below, pay attention to the reload data write timing when changing the interval of the programmable timer interrupts while the programmable timer is running.

The programmable timer counts down at the falling edge of the input clock and at the same time it generates an interrupt if the counter underflows. Then it starts loading the reload data to the counter and the counter data is determined at the next rising edge of the input clock (period shown in as ① in the figure).

Fig. 4.9.5.2 Reload timing for programmable timer

To avoid improper reloading, do not rewrite the reload data after an interrupt occurs until the counter data is determined including the reloading period ①. Be especially careful when using the OSC1 (low-speed clock) as the clock source of the programmable timer and the CPU is operating with the OSC3 (high-speed clock).

## 4.10 Serial Interface ( $SIN$ , $SOUT$ , $SCLK$ , $SRDY$ )

### 4.10.1 Configuration of serial interface

The S1C6P366 has a synchronous clock type 8 bits serial interface built-in.

The configuration of the serial interface is shown in Figure 4.10.1.1.

The CPU, via the 8-bit shift register, can read the serial input data from the  $SIN$  terminal. Moreover, via the same 8-bit shift register, it can convert parallel data to serial data and output it to the  $SOUT$  terminal. The synchronous clock for serial data input/output may be set by selecting by software any one of three types of master mode (internal clock mode: when the S1C6P366 is to be the master for serial input/output) and a type of slave mode (external clock mode: when the S1C6P366 is to be the slave for serial input/output).

Also, when the serial interface is used at slave mode,  $SRDY$  signal which indicates whether or not the serial interface is available to transmit or receive can be output to the  $SRDY$  terminal.

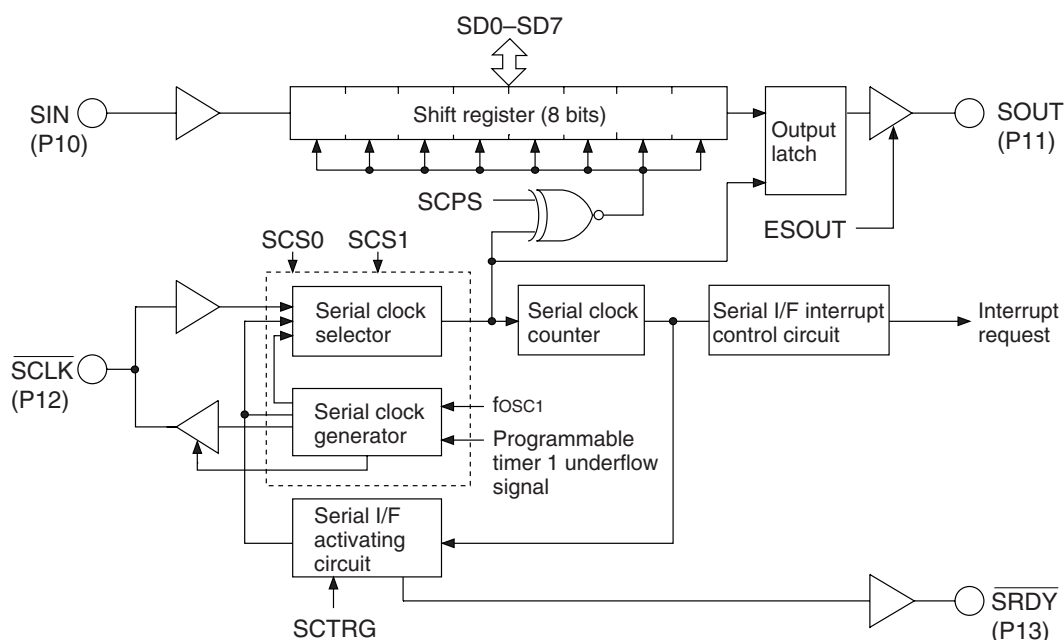

Fig. 4.10.1.1 Configuration of serial interface

The input/output ports of the serial interface are shared with the I/O ports P10–P13, and function of these ports can be selected through the software.

P10–P13 terminals and serial input/output correspondence are as follows:

<u>Master mode</u>	<u>Slave mode</u>
P10 = $SIN$ (I)	P10 = $SIN$ (I)
P11 = $SOUT$ (O)	P11 = $SOUT$ (O)
P12 = $SCLK$ (O)	P12 = $SCLK$ (I)
P13 = I/O port (I/O)	P13 = $SRDY$ (O)

*Note:* At initial reset, P10–P13 are set to I/O ports.

When using the serial interface, switch the function ( $ESIF = "1"$ ) in the initial routine.

The  $SOUT$  (data output) signal passes through a tri-state buffer. To output serial data, write "1" to the  $ESOUT$  register to set the buffer in data output status. When the  $ESOUT$  register is set to "0", the  $SOUT$  signal is disabled and the  $SOUT$  terminal goes high-impedance status.

### 4.10.2 Mask option

#### (1) Terminal specification

Since the input/output terminals of the serial interface is shared with the I/O ports (P10–P13), the terminal specification of the I/O port is also applied to the serial interface.

In the S1C6P366, the I/O ports (P10–P13) specification is fixed at "with pull-up resistor" and "complementary output".

Therefore, the output specification of the terminals SOUT,  $\overline{\text{SCLK}}$  (in master mode) and  $\overline{\text{SRDY}}$  (in slave mode) that are used as output in the input/output port of the serial interface is fixed at complementary output.

Furthermore, a pull-up resistor is provided for the SIN terminal and the  $\overline{\text{SCLK}}$  terminal (in slave mode) that are used as input terminals.

#### (2) Polarity of synchronous clock and ready signal

Polarity of the synchronous clock and the ready signal that is output in the slave mode is fixed at negative polarity (active low).

### 4.10.3 Master mode and slave mode of serial interface

The serial interface of the S1C6P366 has two types of operation mode: master mode and slave mode. The master mode uses an internal clock as the synchronous clock for the built-in shift register, and outputs this internal clock from the  $\overline{\text{SCLK}}$  (P12) terminal to control the external (slave side) serial device. In the slave mode, the synchronous clock output from the external (master side) serial device is input from the  $\overline{\text{SCLK}}$  (P12) terminal and it is used as the synchronous clock for the built-in shift register. The master mode and slave mode are selected by writing data to the SCS1 and SCS0 registers. When the master mode is selected, a synchronous clock may be selected from among 3 types as shown in Table 4.10.3.1.

Table 4.10.3.1 Synchronous clock selection

SCS1	SCS0	Mode	Synchronous clock
1	1	Master mode	OSC1
1	0		OSC1 /2
0	1		Programmable timer *
0	0	Slave mode	External clock *

\* The clock frequency is limited to 1 MHz (max.).

When the programmable timer is selected, the signal that is generated by dividing the underflow signal of the programmable timer (timer 1) in 1/2 is used as the synchronous clock. In this case, the programmable timer must be controlled before operating the serial interface. Refer to Section 4.9, "Programmable Timer" for the control of the programmable timer.

At initial reset, the slave mode (external clock mode) is selected.

Moreover, the synchronous clock, along with the input/output of the 8-bit serial data, is controlled as follows:

- In the master mode, after output of 8 clocks from the  $\overline{\text{SCLK}}$  (P12) terminal, clock output is automatically suspended and the  $\overline{\text{SCLK}}$  (P12) terminal is fixed at high level.
- In the slave mode, after input of 8 clocks to the  $\overline{\text{SCLK}}$  (P12) terminal, subsequent clock inputs are masked.

A sample basic serial input/output portion connection is shown in Figure 4.10.3.1.

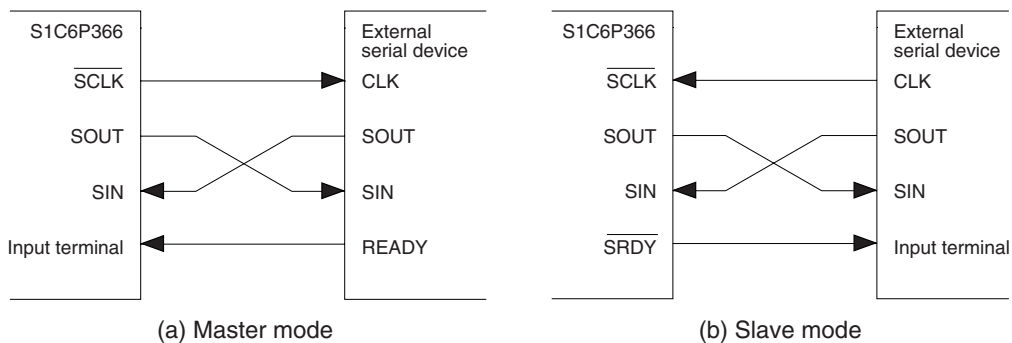

Fig. 4.10.3.1 Sample basic connection of serial input/output section

#### 4.10.4 Data input/output and interrupt function

The serial interface of S1C6P366 can input/output data via the internal 8-bit shift register. The shift register operates by synchronizing with either the synchronous clock output from the  $\overline{\text{SCLK}}$  (P12) terminal (master mode), or the synchronous clock input to the  $\overline{\text{SCLK}}$  (P12) terminal (slave mode). The serial interface generates an interrupt on completion of the 8-bit serial data input/output. Detection of serial data input/output is done by counting of the synchronous clock  $\overline{\text{SCLK}}$ ; the clock completes input/output operation when 8 counts (equivalent to 8 cycles) have been made and then generates an interrupt.

The serial data input/output procedure is explained below:

##### (1) Serial data output procedure and interrupt

The S1C6P366 serial interface is capable of outputting parallel data as serial data, in units of 8 bits. By setting the parallel data to the data registers SD0–SD3 (FF72H) and SD4–SD7 (FF73H) and writing "1" to SCTRG bit (FF70H•D1), it synchronizes with the synchronous clock and the serial data is output to the SOUT (P11) terminal. The synchronous clock used here is as follows: in the master mode, internal clock which is output to the  $\overline{\text{SCLK}}$  (P12) terminal while in the slave mode, external clock which is input from the  $\overline{\text{SCLK}}$  (P12) terminal.

The serial data output to the SOUT (P11) terminal changes at the falling edge of the clock input or output from/to the  $\overline{\text{SCLK}}$  (P12) terminal. The data in the shift register is shifted at the falling edge of the  $\overline{\text{SCLK}}$  signal when the SCPS register (FF71H•D2) is "1" and is shifted at the rising edge of the  $\overline{\text{SCLK}}$  signal when the SCPS register is "0".

When the output of the 8-bit data from SD0 to SD7 is completed, the interrupt factor flag ISIF (FFF3H•D0) is set to "1" and an interrupt occurs. Moreover, the interrupt can be masked by the interrupt mask register EISIF (FFE3H•D0). However, regardless of the interrupt mask register setting, the interrupt factor flag is set to "1" after output of the 8-bit data.

##### (2) Serial data input procedure and interrupt

The S1C6P366 serial interface is capable of inputting serial data as parallel data, in units of 8 bits. The serial data is input from the SIN (P10) terminal, synchronizes with the synchronous clock, and is sequentially read in the 8-bit shift register. As in the above item (1), the synchronous clock used here is as follows: in the master mode, internal clock which is output to the  $\overline{\text{SCLK}}$  (P12) terminal while in the slave mode, external clock which is input from the  $\overline{\text{SCLK}}$  (P12) terminal.

The serial data is read into the built-in shift register at the falling edge of the  $\overline{\text{SCLK}}$  signal when the SCPS register is "1" and is read at the rising edge of the  $\overline{\text{SCLK}}$  signal when the SCPS register is "0". The shift register is sequentially shifted as the data is fetched.

When the input of the 8-bit data from SD0 to SD7 is completed, the interrupt factor flag ISIF (FFF3H•D0) is set to "1" and an interrupt occurs. Moreover, the interrupt can be masked by the interrupt mask register EISIF (FFE3H•D0). However, regardless of the interrupt mask register setting, the interrupt factor flag is set to "1" after input of the 8-bit data.

The data input in the shift register can be read from data registers SD0–SD7 by software.

### (3) Serial data input/output permutation

The S1C6P366 allows the input/output permutation of serial data to be selected by the SDP register (FF71H•D3) as to either LSB first or MSB first. The block diagram showing input/output permutation in case of LSB first and MSB first is provided in Figure 4.10.4.1. The SDP register should be set before setting data to SD0–SD7.

Fig. 4.10.4.1 Serial data input/output permutation

### (4) $\overline{\text{SRDY}}$ signal

When the S1C6P366 serial interface is used in the slave mode (external clock mode),  $\overline{\text{SRDY}}$  signal is used to indicate whether the internal serial interface is available to transmit or receive data for the master side (external) serial device.  $\overline{\text{SRDY}}$  signal is output from the  $\overline{\text{SRDY}}$  (P13) terminal.  $\overline{\text{SRDY}}$  signal goes "0" (low) when the S1C6P366 serial interface is available to transmit or receive data; normally, it is at "1" (high).  $\overline{\text{SRDY}}$  signal changes from "1" to "0" immediately after "1" is written to SCTRG and returns from "0" to "1" when "0" is input to the  $\overline{\text{SCLK}}$  (P12) terminal (i.e., when the serial input/output begins transmitting or receiving data). Moreover, when high-order data is read from or written to SD4–SD7, the  $\overline{\text{SRDY}}$  signal returns to "1".

### (5) Timing chart

The S1C6P366 serial interface timing chart is shown in Figure 4.10.4.2.

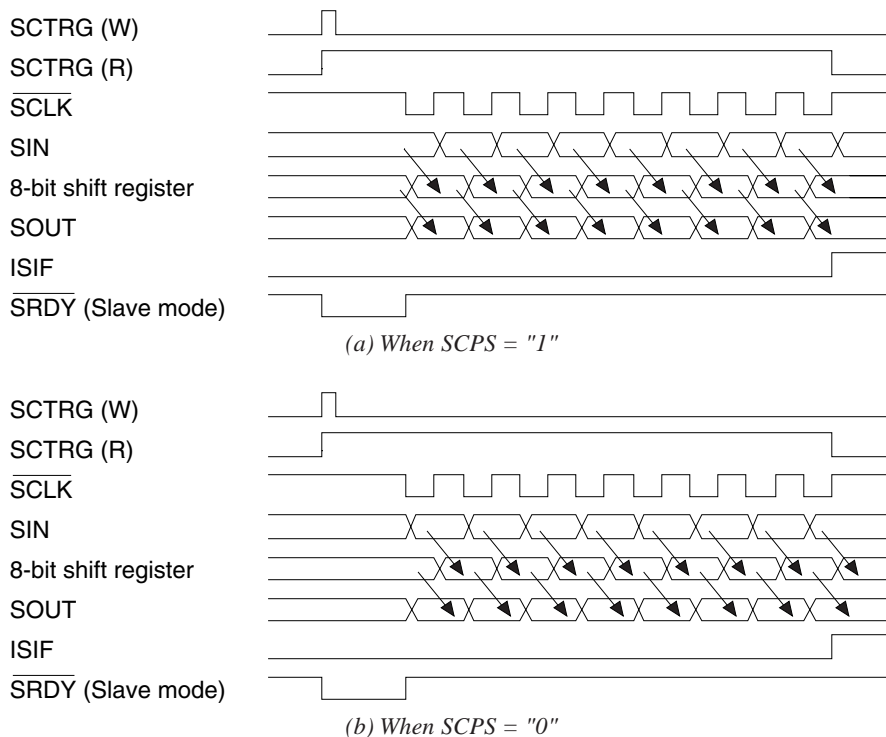

Fig. 4.10.4.2 Serial interface timing chart

### 4.10.5 I/O memory of serial interface

Table 4.10.5.1 shows the I/O addresses and the control bits for the serial interface.

Table 4.10.5.1 Control bits of serial interface

Address	Register				Comment				
	D3	D2	D1	D0	Name	Init *1	1	0	
FF45H	PUL13	PUL12	PUL11	PUL10	PUL13	1	On	Off	P13 pull-up control register functions as a general-purpose register when SIF (slave) is selected
					PUL12	1	On	Off	P12 pull-up control register (ESIF=0) functions as a general-purpose register when SIF (master) is selected
	R/W				PUL11	1	On	Off	$\overline{\text{SCLK}}$ (I) pull-up control register when SIF (slave) is selected
					PUL10	1	On	Off	P11 pull-up control register (ESIF=0) functions as a general-purpose register when SIF is selected P10 pull-up control register (ESIF=0) SIN pull-up control register when SIF is selected
FF70H	0	ESOUT	SCTRG	ESIF	0 *3	– *2			Unused
	R	R/W	ESOUT	0	Enable	Disable	SOUT enable/disable control		
			SCTRG	0	Trigger	Invalid	Serial I/F clock trigger (writing)		
			ESIF	0	Run SIF	Stop I/O	Serial I/F clock status (reading) Serial I/F enable (P1 port function selection)		
FF71H	SDP	SCPS	SCS1	SCS0	SDP	0	MSB first	LSB first	Serial I/F data input/output permutation
	R/W	SCPS	0			Serial I/F clock phase selection	[SCS1, 0]	0	1
		SCS1	0		Serial I/F	Clock	Slave	PT	
		SCS0	0		clock mode selection	[SCS1, 0]	2	3	
FF72H	SD3	SD2	SD1	SD0	SD3	– *2	High	Low	MSB
	R/W	SD2	– *2	High	Low	Serial I/F transmit/receive data (low-order 4 bits)			
		SD1	– *2	High	Low				
		SD0	– *2	High	Low		LSB		
FF73H	SD7	SD6	SD5	SD4	SD7	– *2	High	Low	MSB
	R/W	SD6	– *2	High	Low	Serial I/F transmit/receive data (high-order 4 bits)			
		SD5	– *2	High	Low				
		SD4	– *2	High	Low		LSB		
FFE3H	0	0	0	EISIF	0 *3	– *2			Unused
	R	R/W	0 *3	– *2			Unused		
			0 *3	– *2			Unused		
			EISIF	0	Enable	Mask	Interrupt mask register (Serial I/F)		
FFF3H	0	0	0	ISIF	0 *3	– *2	(R)	(R)	Unused
	R	R/W	0 *3	– *2	Yes	No	Unused		
			0 *3	– *2	(W)	(W)	Unused		
			ISIF	0	Reset	Invalid	Interrupt factor flag (Serial I/F)		

\*1 Initial value at initial reset

\*2 Not set in the circuit

\*3 Constantly "0" when being read

#### ESIF: Serial interface enable register (P1 port function selection) (FF70H•D0)

Sets P10–P13 to the input/output port for the serial interface.

When "1" is written: Serial interface

When "0" is written: I/O port

Reading: Valid

When "1" is written to the ESIF register, P10, P11, P12 and P13 function as  $\overline{\text{SCLK}}$ ,  $\overline{\text{SOUT}}$ ,  $\overline{\text{SCLK}}$ ,  $\overline{\text{SRDY}}$ , respectively.

In the slave mode, the P13 terminal functions as  $\overline{\text{SRDY}}$  output terminal, while in the master mode, it functions as the I/O port terminal.

At initial reset, this register is set to "0".

*Note:* After setting ESIF to "1", wait at least 10  $\mu\text{sec}$  before starting actual data transfer since a hazard may be generated from the P12 ( $\overline{\text{SCLK}}$ ) terminal when ESIF is set to "1".

**ESOUT: SOUT enable/disable control register (FF70H•D2)**

Enables output of the SOUT signal.

When "1" is written: Enabled  
 When "0" is written: Disabled  
 Reading: Valid

When "1" is written to the ESOUT register, the SOUT terminal can output serial data. When "0" is written, the SOUT terminal goes high-impedance status.

At initial reset, this register is set to "0".

**PUL10: SIN (P10) pull-up control register (FF45H•D0)****PUL12:  $\overline{\text{SCLK}}$  (P12) pull-up control register (FF45H•D2)**

Sets the pull-up of the SIN terminal and the  $\overline{\text{SCLK}}$  terminals (in the slave mode).

When "1" is written: Pull-up ON  
 When "0" is written: Pull-up OFF  
 Reading: Valid

Sets the pull-up resistor built into the SIN (P10) and  $\overline{\text{SCLK}}$  (P12) terminals to ON or OFF. (Pull-up resistor is only built in the port selected by mask option.)

$\overline{\text{SCLK}}$  pull-up is effective only in the slave mode. In the master mode, the PUL12 register can be used as a general purpose register.

At initial reset, these registers are set to "1" and pull-up goes ON.

**SCS1, SCS0: Clock mode selection register (FF71H•D0, D1)**

Selects the synchronous clock ( $\overline{\text{SCLK}}$ ) for the serial interface.

Table 4.10.5.2 Synchronous clock selection

SCS1	SCS0	Mode	Synchronous clock
1	1	Master mode	OSC1
1	0		OSC1 / 2
0	1		Programmable timer *
0	0	Slave mode	External clock *

\* The clock frequency is limited to 1 MHz (max.).

Synchronous clock ( $\overline{\text{SCLK}}$ ) is selected from among the above 4 types: 3 types of internal clock and external clock.

When the programmable timer is selected, the signal that is generated by dividing the underflow signal of the programmable timer (timer 1) in 1/2 is used as the synchronous clock. In this case, the programmable timer must be controlled before operating the serial interface. Refer to Section 4.9, "Programmable Timer" for the control of the programmable timer.

At initial reset, external clock is selected.

**SCPS: Clock phase selection register (FF71H•D2)**

Selects the timing for reading in the serial data input from the SIN (P10) terminal.

When "1" is written: Falling edge of  $\overline{\text{SCLK}}$   
 When "0" is written: Rising edge of  $\overline{\text{SCLK}}$   
 Reading: Valid

Select whether the fetching for the serial input data to registers (SD0–SD7) at the rising edge or falling edge of the synchronous signal.

Pay attention to the polarity of the synchronous clock selected by the mask option because the selection content is different.

The input data fetch timing may be selected but output timing for output data is fixed at the falling edge of  $\overline{\text{SCLK}}$ .

At initial reset, this register is set to "0".

**SDP: Data input/output permutation selection register (FF71H•D3)**

Selects the serial data input/output permutation.

When "1" is written: MSB first

When "0" is written: LSB first

Reading: Valid

Select whether the data input/output permutation will be MSB first or LSB first.

At initial reset, this register is set to "0".

**SCTRG: Clock trigger/status (FF70H•D1)**

This is a trigger to start input/output of synchronous clock ( $\overline{\text{SCLK}}$ ).

**• When writing**

When "1" is written: Trigger

When "0" is written: No operation

When this trigger is supplied to the serial interface activating circuit, the synchronous clock ( $\overline{\text{SCLK}}$ ) input/output is started.

As a trigger condition, it is required that data writing or reading on data registers SD0–SD7 be performed prior to writing "1" to SCTRG. (The internal circuit of the serial interface is initiated through data writing/reading on data registers SD0–SD7.) In addition, be sure to enable the serial interface with the ESIF register before setting the trigger.

Supply trigger only once every time the serial interface is placed in the RUN state. Refrain from performing trigger input multiple times, as leads to malfunctioning.

Moreover, when the synchronous clock  $\overline{\text{SCLK}}$  is external clock, start to input the external clock after the trigger.

**• When reading**

When "1" is read: RUN (during input/output the synchronous clock)

When "0" is read: STOP (the synchronous clock stops)

When this bit is read, it indicates the status of serial interface clock.

After "1" is written to SCTRG, this value is latched till serial interface clock stops (8 clock counts). Therefore, if "1" is read, it indicates that the synchronous clock is in input/output operation.

When the synchronous clock input/output is completed, this latch is reset to "0".

At initial reset, this bit is set to "0".

**SD0–SD3, SD4–SD7: Serial interface data register (FF72H, FF73H)**

These registers are used for writing and reading serial data.

**• When writing**

When "1" is written: High level

When "0" is written: Low level

Write data to be output in these registers. The register data is converted into serial data and output from the SOUT (P11) terminal; data bits set at "1" are output as high (VDD) level and data bits set at "0" are output as low (VSS) level.

**• When reading**

When "1" is read: High level

When "0" is read: Low level

The serial data input from the SIN (P10) terminal can be read from these registers.

The serial data input from the SIN (P10) terminal is converted into parallel data, as a high (VDD) level bit into "1" and as a low (VSS) level bit into "0", and is loaded to these registers. Perform data reading only while the serial interface is not running (i.e., the synchronous clock is neither being input or output).

At initial reset, these registers are undefined.

**EISIF: Interrupt mask register (FFE3H•D0)**

Masking the interrupt of the serial interface can be selected with this register.

When "1" is written: Enabled

When "0" is written: Masked

Reading: Valid

With this register, it is possible to select whether the serial interface interrupt is to be masked or not.

At initial reset, this register is set to "0".

**ISIF: Interrupt factor flag (FFF3H•D0)**

This flag indicates the occurrence of serial interface interrupt.

When "1" is read: Interrupt has occurred

When "0" is read: Interrupt has not occurred

When "1" is written: Flag is reset

When "0" is written: Invalid

From the status of this flag, the software can decide whether the serial interface interrupt.

This flag is set to "1" after an 8-bit data input/output even if the interrupt is masked.

This flag is reset to "0" by writing "1" to it.

After an interrupt occurs, the same interrupt will occur again if the interrupt enabled state (I flag = "1") is set or the RETI instruction is executed unless the interrupt factor flag is reset. Therefore, be sure to reset (write "1" to) the interrupt factor flag in the interrupt service routine before shifting to the interrupt enabled state.

At initial reset, this flag is set to "0".

**4.10.6 Programming notes**

- (1) Perform data writing/reading to the data registers SD0–SD7 only while the serial interface is not running (i.e., the synchronous clock is neither being input or output).
- (2) As a trigger condition, it is required that data writing or reading on data registers SD0–SD7 be performed prior to writing "1" to SCTRG. (The internal circuit of the serial interface is initiated through data writing/reading on data registers SD0–SD7.) In addition, be sure to enable the serial interface with the ESIF register before setting the trigger.  
Supply trigger only once every time the serial interface is placed in the RUN state. Refrain from performing trigger input multiple times, as leads to malfunctioning. Moreover, when the synchronous clock SCLK is external clock, start to input the external clock after the trigger.
- (3) Setting of the input/output permutation (MSB first/LSB first) with the SDP register should be done before setting data to SD0–SD7.
- (4) Be aware that the maximum clock frequency for the serial interface is limited to 1 MHz when OSC3 is used as the clock source of the programmable timer or in the slave mode.
- (5) After an interrupt occurs, the same interrupt will occur again if the interrupt enabled state (I flag = "1") is set or the RETI instruction is executed unless the interrupt factor flag is reset. Therefore, be sure to reset (write "1" to) the interrupt factor flag in the interrupt service routine before shifting to the interrupt enabled state.

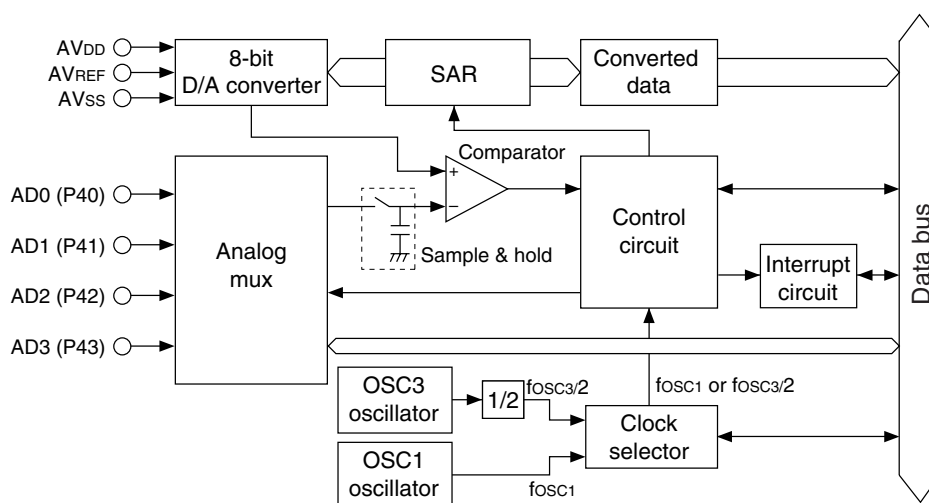

### 4.11 A/D Converter

#### 4.11.1 Characteristics and configuration of A/D converter

The S1C6P366 has a built-in A/D converter with the following characteristics.

- Conversion method: Successive-approximation type
- Resolution: 8 bits  
Maximum error:  $\pm 3$  LSB, A/D clock: OSC1, OSC3,  $V_{DD} = 2.7\text{ V}$  to  $5.5\text{ V}$
- Input channels: Maximum 4 channels
- Conversion time: Minimum  $10.5\text{ }\mu\text{sec}$  (during operation at  $2\text{ MHz}$ )  
Minimum  $641\text{ }\mu\text{sec}$  (during operation at  $32.768\text{ kHz}$ )
- Setting of analog conversion voltage range is possible with reference voltage terminal ( $AV_{REF}$ )
- A/D conversion result is possible to read from 8-bit data register
- Sample & hold circuit built-in
- A/D conversion completion generates an interrupt

Figure 4.11.1.1 shows the configuration of the A/D converter.

*Fig. 4.11.1.1 Configuration of A/D converter*

#### 4.11.2 Terminal configuration of A/D converter

The terminals used with the A/D converter are as follows:

**AV<sub>DD</sub>, AV<sub>SS</sub> (power supply terminal)**

The AVDD and AVSS terminals are power supply terminals for the A/D converter. The voltage should be input as  $AVDD \leq VDD$  and  $AVSS = VSS$ .

**AV<sub>REF</sub>** (reference voltage input terminal)

The AVREF terminal is the reference voltage terminal of the analog block. Input voltage range of the A/D conversion is decided by this input (AVSS–AVREF). The voltage should be input as  $AVREF \leq AVDD$ .

**AD0–AD3 (analog input terminal)**

The analog input terminals AD0–AD3 are shared with the I/O port terminals P40–P43. Therefore, it is necessary to set them for the A/D converter by software when using them as analog input terminals. This setting can be done for each terminal. (Refer to Section 4.11.4 for setting.)

At initial reset, all the terminals are set in the I/O port terminals.

Analog voltage value  $AV_{IN}$  that can be input is in the range of  $AV_{SS} \leq AV_{IN} \leq AV_{REF}$ .

### 4.11.3 Mask option

The analog input terminals of the A/D converter are shared with the I/O port terminals P40–P43. Therefore, the terminal specification of the A/D converter is decided by setting the I/O port mask option. In the S1C6P366, the P40–P43 ports specification is fixed at "without pull-up resistor".

### 4.11.4 Control of A/D converter

#### (1) Setting of A/D input terminal

When using the A/D converter, it is necessary to set up the terminals used for analog input from the P40–P43 initialized as the I/O port terminals. Four terminals can all be used as analog input terminals.

The PAD (PAD0–PAD3) register is used to set analog input terminals. When the PAD register bits are set to "1", the corresponding terminals function as the analog input terminals.

At initial reset, these terminals are all set in the I/O port terminals, and each terminal goes to a high impedance.

Table 4.11.4.1 Correspondence between A/D input terminal and PAD register

Terminal	A/D input enable /disable	Comment
P40 (AD0)	PAD0	
P41 (AD1)	PAD1	
P42 (AD2)	PAD2	
P43 (AD3)	PAD3	

#### (2) Setting of input clock

The clock selector selects the A/D conversion clock from OSC1 or OSC3 according to the value written in the ADCLK register. Table 4.11.4.2 shows the input clock selection with the ADCLK register.

Table 4.11.4.2 Input clock selection

ADCLK	Clock source
0	OSC1
1	OSC3/2

The clock selector outputs the selected clock to the A/D converter by writing "1" to the ADRUN register.

- Note:*
- Be sure to select (change) the input clock while the A/D converter is stopped. Changing the clock during A/D operation may cause problems.
  - To prevent malfunction, do not start A/D conversion (writing "1" to the ADRUN register) when the A/D conversion clock is not being output from the clock selector, and do not turn the clock off during A/D conversion.

#### (3) Input signal selection

The analog signals from the AD0 (P40)–AD3 (P43) terminals are input to the multiplexer, and the analog input channel for A/D conversion is selected by software. This selection can be done using the CHS register as shown in Table 4.11.4.3.

Table 4.11.4.3 Selection of analog input channel

CHS1	CHS0	Input channel
1	1	AD3 (P43)
1	0	AD2 (P42)
0	1	AD1 (P41)
0	0	AD0 (P40)

**(4) A/D conversion operation**

An A/D conversion starts by writing "1" to the ADRUN register (FFD0H•D3).

For example, when performing A/D conversion using AD1 as the analog input, write "1" (0, 1) to the CHS register (CHS1, CHS0). However, it is necessary that the P41 terminal has been set as an analog input terminal. Then write "1" to the ADRUN register. The A/D converter starts converting of the analog signal input to the AD1 terminal.

The built-in sample/hold circuit starts sampling of the analog input specified from tAD after writing. When the sampling is completed, the held analog input voltage is converted into a 8-bit digital value in successive-approximation architecture.

The conversion result is loaded into the ADDR (ADDR0–ADDR7) register. ADDR0 is the LSB and ADDR7 is the MSB.

*Note: If the CHS register selects an input channel which is not included in the analog input terminals set by the PAD register (the PAD register can select several terminals simultaneously), the A/D conversion does not result in a correct converted value.*

Example)

Terminal setting: PAD3 = 1, PAD2–PAD0 = 0 (AD3 terminal is used)

Selection of input channel: CHS1 = 0, CHS0 = 0 (AD0 is selected)

In a setting like this, the A/D conversion result will be invalid because the contents of the settings are not matched.

Figure 4.11.4.1 shows the flow chart for starting an A/D conversion.

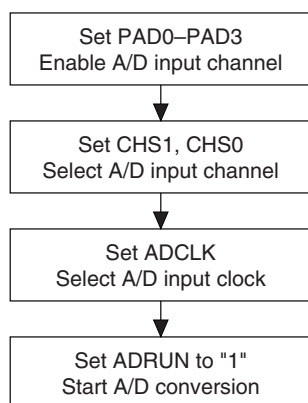

Fig. 4.11.4.1 Flowchart for starting A/D conversion

An A/D conversion is completed when the conversion result is loaded into the ADDR register. At that point, the A/D converter generates an interrupt (explained in the next section).

Figure 4.11.4.2 shows the timing chart of A/D conversion.

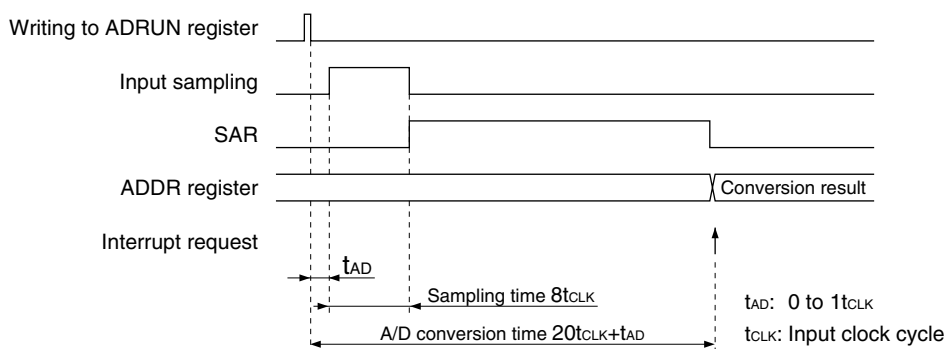

Fig. 4.11.4.2 Timing chart of A/D conversion

### 4.11.5 Interrupt function

The A/D converter can generate an interrupt when an A/D conversion has completed.

Figure 4.11.5.1 shows the configuration of the A/D converter interrupt circuit.

The A/D converter sets the interrupt factor flag IAD to "1" immediately after storing the conversion result to the ADDR register.

At this time, if the interrupt mask register EIAD is "1", an interrupt is generated to the CPU.

By setting the EIAD register to "0", the interrupt to the CPU can be disabled. However, the interrupt factor flag is set to "1" when an A/D conversion has completed regardless of the interrupt mask register setting.

The interrupt factor flag set in "1" is reset to "0" by writing "1".

The interrupt vector for the A/D conversion completion has been set in 010EH.

Fig. 4.11.5.1 Configuration of A/D converter interrupt circuit

### 4.11.6 I/O memory of A/D converter

Table 4.11.6.1 shows the I/O addresses and the control bits for the A/D converter.

Table 4.11.6.1 Control bits of A/D converter

Address	Register								Comment
	D3	D2	D1	D0	Name	Init *1	1	0	
FF01H	VADSEL	VDSEL	0	DBON	VADSEL	0	(Vc2)	(VDD)	(Power source selection for A/D converter)
					VDSEL	0	(Vc2)	(VDD)	(Power source selection for oscillation system voltage regulator)
					0 *3	– *2			Unused

					0 *3	– *2	Yes	No	Unused
					0 *3	– *2	(W)	(W)	Unused
				R/W	IAD	0	Reset	Invalid	Interrupt factor flag (A/D converter)

\*1 Initial value at initial reset

\*2 Not set in the circuit

\*3 Constantly "0" when being read

#### PAD0–PAD3: A/D converter input control register (FFD1H)

Sets the P40–P43 terminals as the analog input terminals for the A/D converter.

When "1" is written: A/D converter input

When "0" is written: I/O port

Reading: Valid

When "1" is written to PADn, the P4n terminal is set to the analog input terminal ADn. (n = 0–3)

When "0" is written, the terminal is used with the I/O port.

At initial reset, this register is set to "0" (I/O port).

#### ADCLK: A/D converter clock source selection register (FFD0H•D2)

Selects the clock source for the A/D converter.

When "1" is written: OSC3

When "0" is written: OSC1

Reading: Valid

When "1" is written to ADCLK, OSC3 is selected as the clock source for the A/D converter.

When "0" is written, OSC1 is selected.

At initial reset, this register is set to "0" (OSC1).

**CHS0, CHS1: Analog input channel selection register (FFD0H•D0, D1)**

Selects an analog input channel.

*Table 4.11.6.2 Selection of analog input channel*

CHS1	CHS0	Input channel
1	1	AD3 (P43)
1	0	AD2 (P42)
0	1	AD1 (P41)
0	0	AD0 (P40)

At initial reset, this register is set to "0" (AD0).

**VADSEL: A/D power source selection register (FF01H•D3)**

In the S1C6P366, the value set in this register does not affect the operating mode (operating voltage) of the A/D converter. However, when using the S1C6P366 as a development tool for the S1C63358/63158, control the operating voltage using this register according to the control sequence of the model (refer to the "Technical Manual").

At initial reset, this register is set to "0" (V<sub>DD</sub>).

**ADRUN: A/D conversion control (FFD0H•D3)**

Starts an A/D conversion.

When "1" is written: Start

When "0" is written: No operation

Reading: Invalid

When "1" is written to ADRUN, the A/D converter starts A/D conversion of the channel selected by the CHS register and stores the conversion result to the ADDR register.

At initial reset, this bit is set to "0".

**ADDR0–ADDR7: A/D conversion result (FFD2H/lower 4 bits, FFD3H/upper 4 bits)**

A/D conversion result is stored.

ADDR0 is the LSB and ADDR7 is the MSB.

At initial reset, data is undefined.

**EIAD: A/D converter interrupt mask register (FFE7H•D0)**

This register is used to select whether to mask the A/D converter interrupt or not.

When "1" is written: Enabled

When "0" is written: Masked

Reading: Valid

Writing "1" to the EIAD register enables the A/D converter interrupt and writing "0" disables the interrupt.

At initial reset, this register is set to "0".

**IAD: A/D converter interrupt factor flag (FFF7H•D0)**

This flag indicates the status of the A/D converter interrupt.

When "1" is read: Interrupt has occurred

When "0" is read: Interrupt has not occurred

When "1" is written: Flag is reset

When "0" is written: Invalid

IAD is the A/D converter interrupt factor flag that is set when an A/D conversion has finished. The software can judge from this flag whether there is an A/D converter interrupt or not. This flag is set to "1" even if the interrupt is masked.

This flag is reset to "0" by writing "1".

After an interrupt occurs, the same interrupt will occur again if the interrupt enabled state (I flag = "1") is set or the RETI instruction is executed unless the interrupt factor flag is reset. Therefore, be sure to reset (write "1" to) the interrupt factor flag in the interrupt service routine before shifting to the interrupt enabled state.

At initial reset, this flag is set to "0".

**4.11.7 Programming notes**

- (1) The A/D converter can operate by inputting the clock from the clock selector. Therefore, it is necessary to select the clock source and to turn the clock output on before starting A/D conversion. Furthermore, it is also necessary that the OSC3 oscillation circuit is operating when using the OSC3 clock.
- (2) When using the OSC3 clock as the A/D conversion clock, do not stop the OSC3 oscillation circuit during A/D conversion. If the OSC3 oscillation circuit stops, correct A/D conversion result cannot be obtained.
- (3) The input clock and analog input terminals should be set when the A/D converter stops. Changing these settings in the A/D converter operation may cause errors.
- (4) To prevent malfunction, do not start A/D conversion (writing "1" to the ADRUN register) when the A/D conversion clock is not being output from the clock selector, and do not turn the clock off during A/D conversion.
- (5) If the CHS register selects an input channel which is not included in the analog input terminals set by the PAD register (the PAD register can select several terminals simultaneously), the A/D conversion does not result in a correct converted value.
- (6) During A/D conversion, do not operate the P4n terminals which are not used for analog inputs of the A/D converter (for input/output of digital signals). It affects the A/D conversion precision.
- (7) In the S1C6P366, the value set in the VADSEL register does not affect the operating mode (operating voltage) of the A/D converter. However, when using the S1C6P366 as a development tool for the S1C63358/63158, control the operating voltage using the VADSEL register according to the control sequence of the model (refer to the "Technical Manual").

## 4.12 Buzzer Output Circuit

### 4.12.1 Configuration of buzzer output circuit

The S1C6P366 is capable of generating buzzer signal to drive a piezo-electric buzzer. The buzzer signal is output from the BZ terminal by software control. Furthermore, the buzzer signal frequency can be set to 2 kHz or 4 kHz with 2 Hz interval by software.

Figure 4.12.1.1 shows the configuration of the buzzer output circuit.

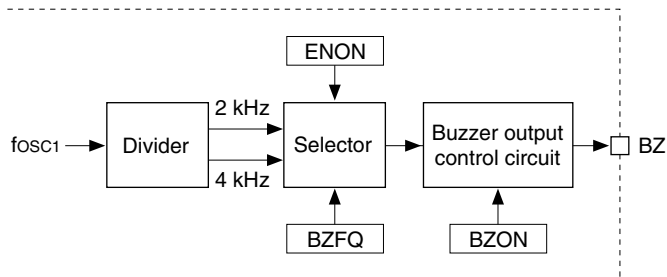

Fig. 4.12.1.1 Configuration of buzzer output circuit

### 4.12.2 Mask option

In the S1C6P366, polarity of the buzzer signal output from the BZ terminal is fixed at negative polarity. The BZ terminal goes to a high ( $V_{DD}$ ) level when the buzzer signal is not output. Drive a piezo buzzer by externally connecting an PNP transistor.

Fig. 4.12.2.1 Configuration of output circuit

4.12.3 Control of buzzer output

The buzzer signal frequency is selected by the buzzer frequency selection register BZFQ. When "1" is written to the BZFQ register, the frequency is set to 2 kHz. When "0" is written, it is set to 4 kHz. This signal is generated by dividing the fosc1.

fosc1	2 kHz	4 kHz
32.768 kHz	fosc1 /16	fosc1 /8

The buzzer signal is output from the BZ terminal by writing "1" to the buzzer output control register BZON. The BZ terminal goes to a high (VDD) level by writing "0".

Fig. 4.12.3.1 Timing chart of buzzer signal output

2 Hz intervals can be added to the buzzer signal when "1" is written to the ENON register.

Fig. 4.12.3.2 2 Hz interval

*Note: Since it generates a buzzer signal that is out of synchronization with the BZON register, hazards may at times be produced when the signal goes ON/OFF due to the setting of the BZON register.*

#### 4.12.4 I/O memory of buzzer output circuit

Table 4.12.4.1 shows the I/O address and the control bits for the buzzer output circuit.

Table 4.12.4.1 Control bits of buzzer output circuit

Address	Register									Comment
	D3	D2	D1	D0	Name	Init *1	1	0		
FF64H	0	ENON	BZFQ	BZON	0 *3	— *2			Unused	
					ENON	0	On	Off	2 Hz interval On/Off	
					BZFQ	0	2 kHz	4 kHz	Buzzer frequency selection	
	R	R/W			BZON	0	On	Off	Buzzer output On/Off	

\*1 Initial value at initial reset

\*2 Not set in the circuit

\*3 Constantly "0" when being read

##### ENON: Interval ON/OFF control register (FF64H•D2)

Controls the addition of a 2 Hz interval onto the buzzer signal.

When "1" is written: ON

When "0" is written: OFF

Reading: Valid

Writing "1" into the ENON causes a 2 Hz ON/OFF interval to be added during buzzer signal output.

When "0" has been written, a 2 Hz ON/OFF interval is not added.

At initial reset, this register is set to "0".

##### BZFQ: Buzzer frequency selection register (FF64H•D1)

Selects the buzzer signal frequency.

When "1" is written: 2 kHz

When "0" is written: 4 kHz

Reading: Valid

When "1" is written to BZFQ, the frequency is set to 2 kHz. When "0" is written, it is set to 4 kHz.

At initial reset, this register is set to "0".

##### BZON: Buzzer output control (ON/OFF) register (FF64H•D0)

Controls the buzzer signal output.

When "1" is written: Buzzer output ON

When "0" is written: Buzzer output OFF

Reading: Valid

When "1" is written to BZON, the buzzer signal is output from the BZ terminal. When "0" is written, the BZ terminal goes to a high (VDD) level.

At initial reset, this register is set to "0".

#### 4.12.5 Programming note

Since it generates a buzzer signal that is out of synchronization with the BZON register, hazards may at times be produced when the signal goes ON/OFF due to the setting of the BZON register.

## 4.13 SVD (Supply Voltage Detection) Circuit

### 4.13.1 Configuration of SVD circuit

The S1C6P366 has a built-in SVD (supply voltage detection) circuit, so that the software can find when the source voltage lowers. Turning the SVD circuit ON/OFF and the SVD criteria voltage setting can be done with software.

Figure 4.13.1.1 shows the configuration of the SVD circuit.

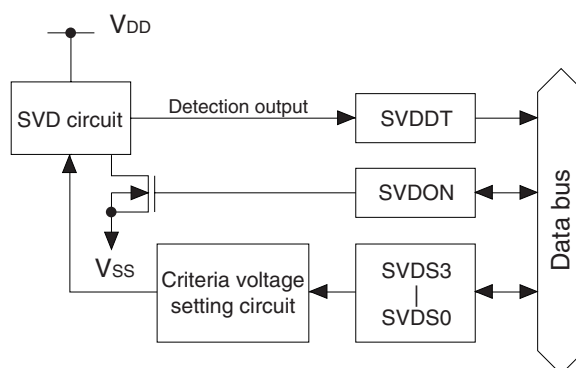

Fig. 4.13.1.1 Configuration of SVD circuit

### 4.13.2 SVD operation

The SVD circuit compares the criteria voltage set by software and the supply voltage ( $V_{DD}-V_{SS}$ ) and sets its results into the SVDDT latch. By reading the data of this SVDDT latch, it can be determined by means of software whether the supply voltage is normal or has dropped.

The criteria voltage can be set for the 2 types shown in Table 4.13.2.1 by the SVDS3–SVDS0 registers.

Table 4.13.2.1 Criteria voltage setting

SVDS3	SVDS2	SVDS1	SVDS0	Criteria voltage (V)
0	1	1	1	Not allowed
0	1	1	0	Not allowed
0	1	0	1	Not allowed
0	1	0	0	Not allowed
0	0	1	1	Not allowed
0	0	1	0	Not allowed
0	0	0	1	Not allowed
0	0	0	0	Not allowed
1	1	1	1	2.80
1	1	1	0	2.70
1	1	0	1	Not allowed
1	1	0	0	Not allowed
1	0	1	1	Not allowed
1	0	1	0	Not allowed
1	0	0	1	Not allowed
1	0	0	0	Not allowed

Be aware that the SVD circuit in the S1C6P366 does not operate properly if the SVDS register is set to 13 or less, the SVD operation cannot be guaranteed since the lower limit of the operating voltage is 2.7 V. When the SVDON register is set to "1", source voltage detection by the SVD circuit is executed. As soon as the SVDON register is reset to "0", the result is loaded to the SVDDT latch and the SVD circuit goes OFF. To obtain a stable detection result, the SVD circuit must be ON for at least 100  $\mu$ sec. So, to obtain the SVD detection result, follow the programming sequence below.

1. Set SVDON to "1"
2. Maintain for 100  $\mu$ sec minimum
3. Set SVDON to "0"
4. Read SVDDT

When the SVD circuit is ON, the IC draws a large current, so keep the SVD circuit off unless it is.

### 4.13.3 I/O memory of SVD circuit

Table 4.13.3.1 shows the I/O addresses and the control bits for the SVD circuit.

Table 4.13.3.1 Control bits of SVD circuit

Address	Register														
	D3	D2	D1	D0	Name	Init *1	1	0	Comment						
FF04H	SVDS3	SVDS2	SVDS1	SVDS0	SVDS3	0			SVD criteria voltage setting [SVDS3-0] 0 1 2 3 4 5 6 7 Voltage(V) – – – – – – – [SVDS3-0] 8 9 10 11 12 13 14 15 Voltage(V) – – – – – – 2.70 2.80						
					SVDS2	0

					0 *3	– *2			Unused						
	R			R/W	SVDDT	0	Low	Normal	SVD evaluation data						
					SVDON	0	On	Off	SVD circuit On/Off						

## 4.14 Interrupt and HALT

---

### <Interrupt types>

The S1C6P366 provides the following interrupt functions.

External interrupt:	• Input interrupt	(3 systems)
Internal interrupt:	• Watchdog timer interrupt	(NMI, 1 system)
	• Programmable timer interrupt	(2 systems)
	• Serial interface interrupt	(1 system)
	• Timer interrupt	(4 systems)
	• A/D converter interrupt	(1 system)

To authorize interrupt, the interrupt flag must be set to "1" (EI) and the necessary related interrupt mask registers must be set to "1" (enable).

When an interrupt occurs the interrupt flag is automatically reset to "0" (DI), and interrupts after that are inhibited.

The watchdog timer interrupt is an NMI (non-maskable interrupt), therefore, the interrupt is generated regardless of the interrupt flag setting. Also the interrupt mask register is not provided. However, it is possible to not generate NMI since software can stop the watchdog timer operation.

Figure 4.14.1 shows the configuration of the interrupt circuit.

*Note: After an initial reset, all the interrupts including NMI are masked until both the stack pointers SP1 and SP2 are set with the software. Be sure to set the SP1 and SP2 in the initialize routine. Further, when re-setting the stack pointer, the SP1 and SP2 must be set as a pair. When one of them is set, all the interrupts including NMI are masked and interrupts cannot be accepted until the other one is set.*

### <HALT>

The S1C6P366 has HALT functions that considerably reduce the current consumption when it is not necessary.

The CPU enters HALT status when the HALT instruction is executed.

In HALT status, the operation of the CPU is stopped. However, timers continue counting since the oscillation circuit operates. Reactivating the CPU from HALT status is done by generating a hardware interrupt request including NMI.

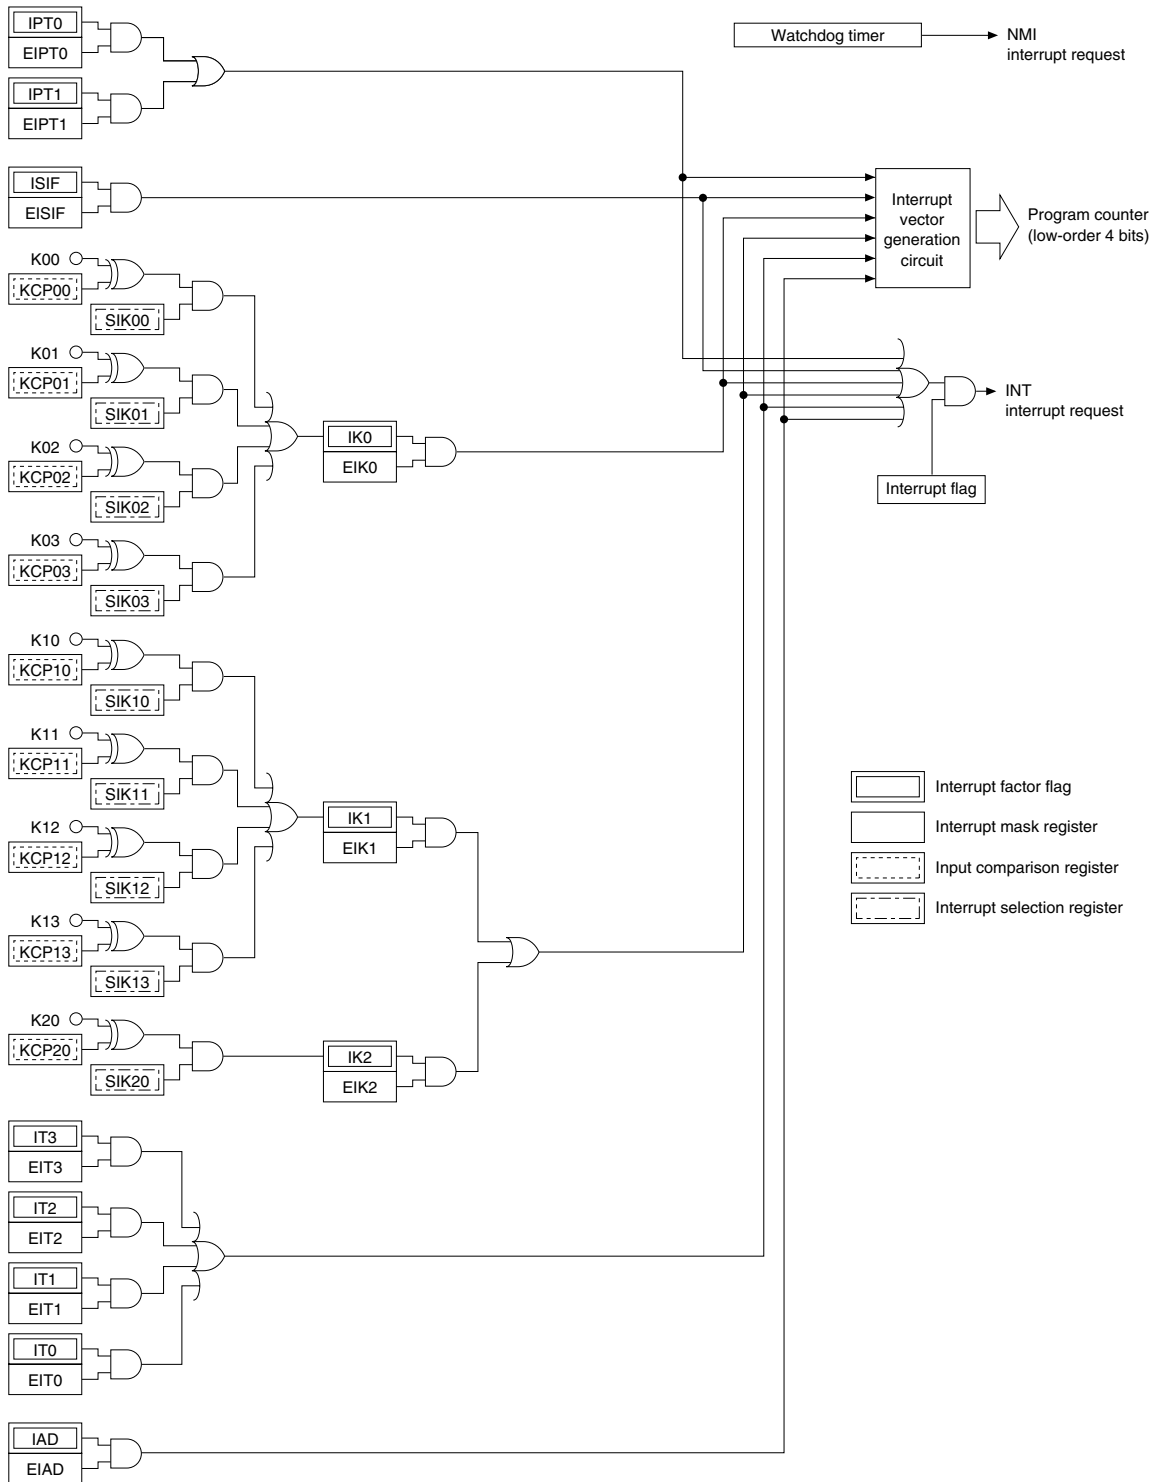

Fig. 4.14.1 Configuration of the interrupt circuit

### 4.14.1 Interrupt factor

Table 4.14.1.1 shows the factors for generating interrupt requests.

The interrupt flags are set to "1" depending on the corresponding interrupt factors.

The CPU operation is interrupted when an interrupt factor flag is set to "1" if the following conditions are established.

- The corresponding mask register is "1" (enabled)
- The interrupt flag is "1" (EI)

The interrupt factor flag is reset to "0" when "1" is written.

At initial reset, the interrupt factor flags are reset to "0".

- \* Since the watchdog timer's interrupt is NMI, the interrupt is generated regardless of the setting above, and no interrupt factor flag is provided.

Table 4.14.1.1 Interrupt factors

Interrupt factor	Interrupt factor flag
Programmable timer 1 (counter = 0)	IPT1 (FFF2H•D1)
Programmable timer 0 (counter = 0)	IPT0 (FFF2H•D0)
Serial interface (8-bit data input/output completion)	ISIF (FFF3H•D0)
K00–K03 input (falling edge or rising edge)	IK0 (FFF4H•D0)
K10–K13 input (falling edge or rising edge)	IK1 (FFF5H•D0)
K20 input (falling edge or rising edge)	IK2 (FFF5H•D1)
Clock timer 1 Hz (falling edge)	IT3 (FFF6H•D3)
Clock timer 2 Hz (falling edge)	IT2 (FFF6H•D2)
Clock timer 8 Hz (falling edge)	IT1 (FFF6H•D1)
Clock timer 16 Hz (falling edge)	IT0 (FFF6H•D0)
A/D converter	IAD (FFF7H•D0)

*Note: After an interrupt occurs, the same interrupt will occur again if the interrupt enabled state (I flag = "1") is set or the RETI instruction is executed unless the interrupt factor flag is reset. Therefore, be sure to reset (write "1" to) the interrupt factor flag in the interrupt service routine before shifting to the interrupt enabled state.*

### 4.14.2 Interrupt mask

The interrupt factor flags can be masked by the corresponding interrupt mask registers.

The interrupt mask registers are read/write registers. They are enabled (interrupt authorized) when "1" is written to them, and masked (interrupt inhibited) when "0" is written to them.

At initial reset, the interrupt mask register is set to "0".

Table 4.14.2.1 shows the correspondence between interrupt mask registers and interrupt factor flags.

Table 4.14.2.1 Interrupt mask registers and interrupt factor flags

Interrupt mask register		Interrupt factor flag	
EIPT1	(FFE2H•D1)	IPT1	(FFF2H•D1)
EIPT0	(FFE2H•D0)	IPT0	(FFF2H•D0)
EISIF	(FFE3H•D0)	ISIF	(FFF3H•D0)
EIK0	(FFE4H•D0)	IK0	(FFF4H•D0)
EIK1	(FFE5H•D0)	IK1	(FFF5H•D0)
EIK2	(FFE5H•D1)	IK2	(FFF5H•D1)
EIT3	(FFE6H•D3)	IT3	(FFF6H•D3)
EIT2	(FFE6H•D2)	IT2	(FFF6H•D2)
EIT1	(FFE6H•D1)	IT1	(FFF6H•D1)
EIT0	(FFE6H•D0)	IT0	(FFF6H•D0)
EIAD	(FFE7H•D0)	IAD	(FFF7H•D0)

### 4.14.3 Interrupt vector

When an interrupt request is input to the CPU, the CPU begins interrupt processing. After the program being executed is terminated, the interrupt processing is executed in the following order.

- 1 The content of the flag register is evacuated, then the I flag is reset.
- 2 The address data (value of program counter) of the program to be executed next is saved in the stack area (RAM).
- 3 The interrupt request causes the value of the interrupt vector (0100H–010EH) to be set in the program counter.
- 4 The program at the specified address is executed (execution of interrupt processing routine by software).

Table 4.14.3.1 shows the correspondence of interrupt requests and interrupt vectors.

Table 4.14.3.1 Interrupt request and interrupt vectors

Interrupt vector	Interrupt factor	Priority
0100H	Watchdog timer	High ↑
0104H	Programmable timer	
0106H	Serial interface	
0108H	K00–K03 input	
010AH	K10–K13 input, K20 input	
010CH	Clock timer	↓ Low
010EH	A/D converter	

The four low-order bits of the program counter are indirectly addressed through the interrupt request.

### 4.14.4 I/O memory of interrupt

Tables 4.14.4.1(a) and (b) show the I/O addresses and the control bits for controlling interrupts.

Table 4.14.4.1(a) Control bits of interrupt (1)

Address	Register								Comment
	D3	D2	D1	D0	Name	Init *1	1	0

#### ***4.14.5 Programming notes***

- (1) The interrupt factor flags are set when the interrupt condition is established, even if the interrupt mask registers are set to "0".
- (2) After an interrupt occurs, the same interrupt will occur again if the interrupt enabled state (I flag = "1") is set or the RETI instruction is executed unless the interrupt factor flag is reset. Therefore, be sure to reset (write "1" to) the interrupt factor flag in the interrupt service routine before shifting to the interrupt enabled state.
- (3) After an initial reset, all the interrupts including NMI are masked until both the stack pointers SP1 and SP2 are set with the software. Be sure to set the SP1 and SP2 in the initialize routine. Further, when re-setting the stack pointer, the SP1 and SP2 must be set as a pair. When one of them is set, all the interrupts including NMI are masked and interrupts cannot be accepted until the other one is set.

# CHAPTER 5 PROM PROGRAMMING AND OPERATING MODE

The S1C6P366 has built-in Flash EEPROMs as the code PROM and the segment option PROM that allow the developer to program the PROM data using the exclusive PROM writer (Universal ROM Writer II (S5U1C88000W1)). This chapter explains the PROM programmer that controls data writing and the writing mode.

## 5.1 Configuration of PROM Programmer

The configuration of the PROM programmer is shown in Figure 5.1.1.

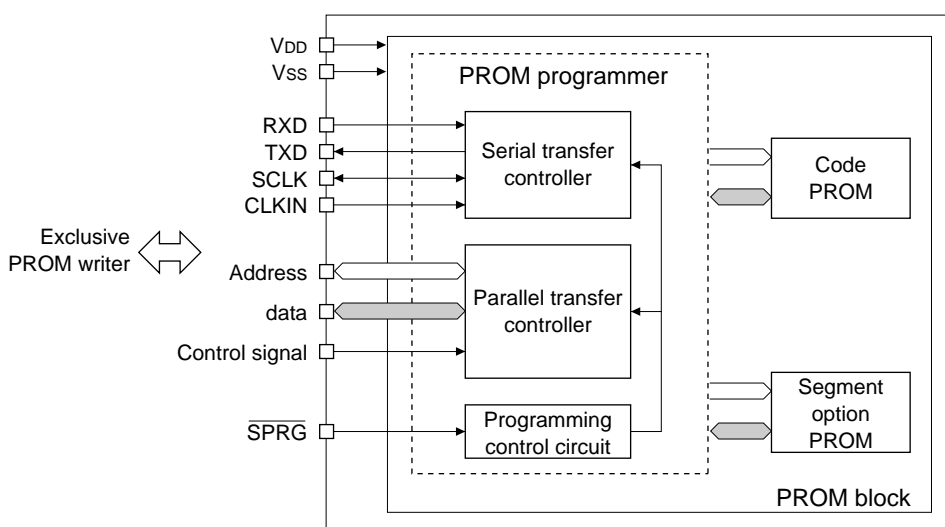

Fig. 5.1.1 Configuration of PROM programmer

The PROM programmer supports the following two writing modes.

- 1) Serial Programming
- 2) Parallel Programming

Serial programming mode uses the serial communication ports of the PROM writer and S1C6P366 to write data. This mode enables on-board programming by designing the target board with a serial writing function. In parallel programming mode, the on-chip PROM can be directly programmed using the exclusive PROM writer with the adaptor socket installed. Refer to Section 5.2, "Operating Mode", for each programming method.

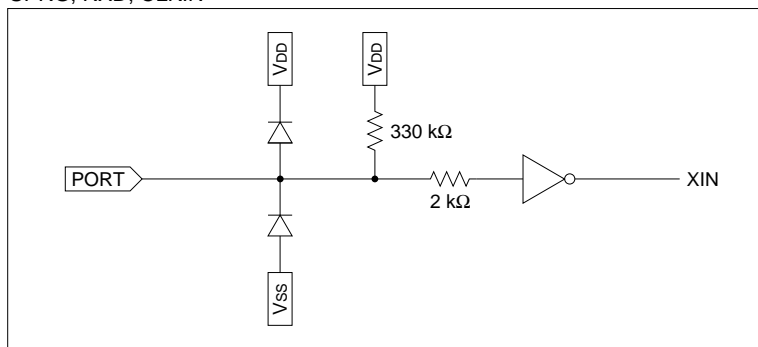

### Terminals

The S1C6P366 provides the following terminals for programming the Flash EEPROM.

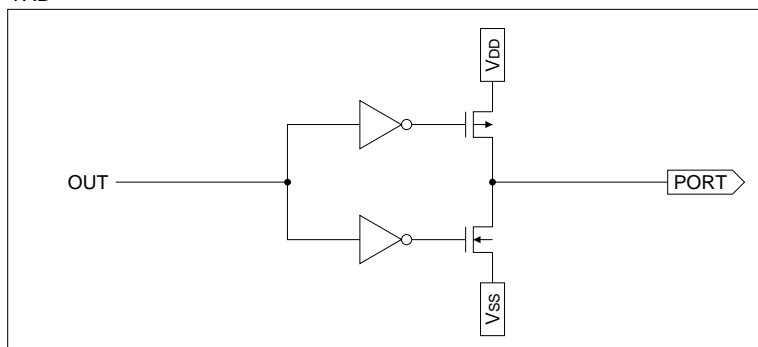

- SPRG:** Flash programming control terminal (pull-up resistor built-in)  
 When set to High ..... Normal operation mode (The CPU executes the program in the Flash EEPROM.)  
 When set to Low ..... Programming mode (for writing data to the Flash EEPROM)
- SCLK:** Serial transfer clock input/output terminal for Serial Programming (pull-up resistor built-in)
- RXD:** Serial data input terminal for Serial Programming (pull-up resistor built-in)
- TXD:** Serial data output terminal for Serial Programming
- CLKIN:** PROM programmer clock input terminal (1 MHz; pull-up resistor built-in)

The five terminals above are provided exclusively for the Flash EEPROM. The S1C63358 and S1C63158 do not have these terminals.

$\overline{\text{SPRG}}$ , RXD, CLKIN

TXD

SCLK

Fig. 5.1.2 Terminal specifications

## 5.2 Operating Mode

Three operating modes are available in the S1C6P366: one is for normal operation and the others are for programming.

The operating mode is decided by the terminal setting at power-on or initial reset.

When the  $\overline{\text{SPRG}}$  terminal is set to Low, the S1C6P366 enters serial programming mode. To operate the S1C6P366 in normal operation mode (to execute the instruction written to the Flash EEPROM after programming), the  $\overline{\text{SPRG}}$  terminal should be set to High or open.

The parallel programming including the mode switching and terminal settings is controlled by the exclusive PROM writer.

Table 5.2.1 lists the operating modes.

Table 5.2.1 Mode setting by  $\overline{\text{SPRG}}$  terminal

Operating mode	$\overline{\text{SPRG}}$ terminal
Normal mode	High or open
Serial programming mode	Set by PROM writer
Parallel programming mode	Set by PROM writer

### 5.2.1 Normal operation mode

In this mode, the S1C63000 core CPU and the peripheral circuits operate by the instructions programmed in the Flash EEPROM. Note that inspection data is written to the PROM at shipment.

In normal operation mode, set the terminals for programming the Flash EEPROM as shown in Table 5.2.1.1. The board must be designed so that the terminal settings cannot be changed while the IC is operating.

Table 5.2.1.1 Terminal settings in normal operation mode

Terminal	Setting
$\overline{\text{SPRG}}$	High or open
SCLK	High or open
RXD	High or open
TXD	Open
CLKIN	High or open

When the  $\overline{\text{SPRG}}$  terminal is set to Low, the S1C6P366 starts operating in serial programming mode after power-on or an initial reset.

Be sure not to change the  $\overline{\text{SPRG}}$  terminal status during normal operation, because the operating mode may change according to the terminal status.

### 5.2.2 Serial programming mode

Serial programming mode writes data to the Flash EEPROM using a serial communication between the exclusive PROM writer (Universal ROM Writer II) and the S1C6P366. By providing a serial communication port on the target board, the S1C6P366 on the board can be programmed (on-board writing).

Table 5.2.2.1 Terminal settings in serial programming mode

Terminal	Setting
$\overline{\text{SPRG}}$	Connected to PROM writer
SCLK	Connected to PROM writer
RXD	Connected to PROM writer
TXD	Connected to PROM writer
CLKIN	Connected to PROM writer

The serial programming is performed using the 1 MHz clock supplied from the PROM writer to the CLKIN terminal. Take noise measure into consideration so that noise does not affect the clock line input to the CLKIN terminal when designing the target board.

### ***5.2.3 Parallel programming mode***

The parallel programming can be performed by installing the S1C6P366 to the exclusive PROM writer via the adaptor socket. In this mode, it is not necessary to set up the programming terminals since it is controlled by the exclusive PROM writer. When using a chip, perform on-board programming in serial programming mode.

# CHAPTER 6 DIFFERENCES FROM MASK ROM MODELS

This chapter explains the differences in functions (except for the Flash EEPROM block) between the S1C6P366 and the mask ROM models (S1C63358 and S1C63158).

## 6.1 Differences from S1C63358

### 6.1.1 Terminal configuration

The S1C6P366 uses the same package (QFP15-100pin) as the S1C63358. Since the terminals for the PROM programmer added to the S1C6P366 are assigned to the unused terminals of the S1C63358, the terminal assignment is compatible with the S1C63358.

Table 6.1.1.1 Terminal assignment (QFP15-100pin)

No.	Pin name		No.	Pin name		No.	Pin name		No.	Pin name	
	S1C6P366	S1C63358		S1C6P366	S1C63358		S1C6P366	S1C63358		S1C6P366	S1C63358

### 6.1.2 Mask option

The S1C6P366 cannot specify the S1C63358 mask options individually.

The following option combination is provided for the S1C6P366.

*Note: Recommended LCD segment option data is include in the S5U1C6P366Y1 package. Modifying the LCD segment opotion is done at the user's own risk.*

*For the LCD segment specifications, both the segment allocation and the output specification can be selected similarly to the S1C63358. Create segment option data using the segment option generator SOG63358 and write it to the segment option PROM in the S1C6P366. The selected option specifications are automatically set to each segment terminal.*

Table 6.1.2.1 Combination of mask options

Mask option		S1C6P366E (Type E)	S1C6P366F (Type F)
OSC1 oscillation circuit		Crystal (32.768 kHz)	Crystal (32.768 kHz)
OSC3 oscillation circuit		Ceramic	CR
Multiple key reset combination		Not used	Not used
Multiple key reset time authorize		Not used	Not used
Input port pull-up resistors	K00	With pull-up resistor	With pull-up resistor
	K01	With pull-up resistor	With pull-up resistor
	K02	With pull-up resistor	With pull-up resistor
	K03	With pull-up resistor	With pull-up resistor
	K10	With pull-up resistor	With pull-up resistor
	K11	With pull-up resistor	With pull-up resistor
	K12	With pull-up resistor	With pull-up resistor
	K13	With pull-up resistor	With pull-up resistor
	K20	With pull-up resistor	With pull-up resistor
Output port output specifications	R10–R13	Complementary output	Complementary output
	R20–R23	Complementary output	Complementary output
I/O port output specifications	P10–P13	Complementary output	Complementary output
	P20	Complementary output	Complementary output

LCD drive bias		1/3 bias (internal)	1/3 bias (internal)
Serial interface signal polarity		Negative polarity	Negative polarity
Buzzer output specification		Negative polarity	Negative polarity

### 6.1.3 Power supply

#### Supply voltage range

S1C6P366: 2.7 V to 5.5 V

S1C63358: 0.9 V to 3.6 V

The S1C6P366 cannot operate with a less than 2.7 V supply voltage. Note that this difference affects the electrical characteristics.

#### Operating mode of oscillation system voltage regulator and internal operating voltage

The oscillation system voltage regulator in the S1C63358 can operate in Vc2 mode (uses the Vc2 voltage generated by the LCD system voltage circuit) when the supply voltage is within the range of 0.9 V to 1.4 V. When the supply voltage is within the range of 1.4 V to 3.6 V, the oscillation system voltage regulator can operate in normal mode (uses the VDD supply voltage). Therefore, the operating mode of the S1C63358 needs to be switched according to the supply voltage using the VDSEL register (FF01H•D2). Since the S1C6P366 does not operate with less than 2.7 V supply voltage, this switching is not necessary. Although the VDSEL register is provided for developing the S1C63358 application, the register value does not affect the operating mode (fixed at normal mode).

The oscillation system voltage regulator generates the VD1 voltage for driving the oscillation circuit. The S1C63358 uses VD1 as the operating voltage of the internal logic circuits (CPU, PROM, RAM and peripheral digital circuits) as well. The VD1 voltage level must be switched using the VDC register (FF00H•D0) according to the oscillation circuit used and the supply voltage.

In the S1C6P366, this switching is not necessary because the VD1 voltage level is fixed at 2.05 V. Furthermore, the VD1 voltage is used only for the OSC1 oscillation circuit, and the OSC3 oscillation circuit and other internal logic circuits operate with VDD as the source voltage. The VDC register value does not affect the VD1 voltage level (it does however, affect switching of the CPU clock). Table 6.1.3.1 shows the operating mode of the oscillation system voltage regulator and the VD1 voltage value, and Table 6.1.3.2 shows the I/O map of the control registers.

Table 6.1.3.1 Operating mode of oscillation system voltage regulator and VD1

##### S1C63358

Power supply circuit	Operating condition	VD1 (V)	Supply voltage VDD (V)			
			0.9–1.4	1.4–2.3	2.3–3.6	3.6–5.5
Oscillation system voltage regulator	OSC1	1.35	Vc2 mode	Normal mode		Not allowed
	OSC3, 4 MHz	2.25	Not allowed		Normal mode	Not allowed

##### S1C6P366

Power supply circuit	Operating condition	VD1 (V)	Supply voltage VDD (V)			
			0.9–1.4	1.4–2.7	2.7–3.6	3.6–5.5
Oscillation system voltage regulator	OSC1	2.05	Not allowed		Normal mode	
	OSC3, 4 MHz	VDD	Not allowed		Normal mode	

##### S1C63358

Table 6.1.3.2 I/O memory map

Address	Register				Name	Init	1	0	Comment
	D3	D2	D1	D0

FF01H	VADSEL	VDSEL	0	DBON	VADSEL	0	(Vc2)	(VDD)	(Power source selection for A/D converter)
					VDSEL	0	(Vc2)	(VDD)	(Power source selection for oscillation system voltage regulator)
	R/W	R	R/W	DBON	0	–			Unused
					0	1	0		General-purpose register

## LCD drive voltage (VC1–VC3)

The LCD system voltage circuit generates VC2 with the voltage regulator built-in, and generates two other voltages by boosting or reducing the voltage VC2. ( $VC1 = 1/2 \cdot VC2$ ,  $VC3 = 3/2 \cdot VC2$ ).

Furthermore, the LCD drive bias option is fixed at 1/3 bias in the S1C6P366. Therefore, the 1/2 bias ( $VC2 = VC1$ ,  $VC3 = 2 \cdot VC1$ ) drive allowed in the S1C63358 cannot be evaluated.

## Operating mode of A/D converter power supply

The A/D converter in the S1C63358 can operate in VC2 mode (uses the VC2 voltage generated by the LCD system voltage circuit) when the supply voltage is within the range of 0.9 V to 1.6 V. When the supply voltage is within the range of 1.6 V to 3.6 V, the A/D converter can operate in normal mode (uses the VDD supply voltage). Therefore, the operating mode of the S1C63358 needs to be switched according to the supply voltage using the VADSEL register (FF01H•D3). Since the S1C6P366 does not operate with a less than 2.7 V supply voltage, this switching is not necessary. Although the VADSEL register is provided for developing the S1C63358 application, the register value does not affect the operating mode (fixed at normal mode).

Table 6.1.3.3 shows the operating mode of the A/D converter power supply, and Table 6.1.3.4 shows the I/O map of the control registers.

Table 6.1.3.3 Operating mode of A/D converter power supply

### S1C63358

Circuit	Supply voltage VDD (V)		
	0.9–1.6	1.6–3.6	3.6–5.5
A/D converter	VC2 mode	Normal mode	Not allowed

### S1C6P366

Circuit	Supply voltage VDD (V)		
	0.9–2.7	2.7–3.6	3.6–5.5
A/D converter	Not allowed	Normal mode

FF01H	VADSEL	VDSEL	0	DBON	VADSEL	0	(VC2)	(VDD)	(Power source selection for A/D converter)
					VDSEL	0	(VC2)	(VDD)	(Power source selection for oscillation system voltage regulator)
	R/W		R	R/W	0	–			Unused
					DBON	0	1	0	General-purpose register

### 6.1.4 Initial reset

When the power is turned on, the reset terminal must be set at Low level until the supply voltage rises to the  $V_{sr}$  level.

Fig. 6.1.4.1 Initial reset at power-on

The  $V_{sr}$  voltage level is different:

S1C63358:  $V_{sr} = 1.4 \text{ V}$

S1C6P366:  $V_{sr} = 2.7 \text{ V}$

Furthermore, S1C6P366 uses the initial reset signal as a trigger for setting either the normal operation mode or the programming mode. Therefore, design the reset input circuit so that the IC will be reset for sure. Initial resetting during operation is the same as the S1C63358.

When resetting the IC in the normal operation mode, make sure to fix the  $\overline{SPRG}$  terminal at High level or leave open.

### 6.1.5 PROM, RAM

The S1C6P366 employs a Flash EEPROM for the internal PROM. The Flash EEPROM can be rewritten up to 100 times. Rewriting data is done at the user's own risk.

Table 6.1.5.1 lists the code PROM and RAM sizes of the S1C6P366 and the S1C63358.

Table 6.1.5.1 Memory size

Memory	S1C6P366	S1C63358
Code PROM	16,384 × 13 bits	8,192 × 13 bits
Data RAM	2,048 × 4 bits	512 × 4 bits

When developing an application for the S1C63358, pay attention to the memory size.

### 6.1.6 I/O memory

The DBON register (FF01H•D0) exists in the I/O memory of the S1C6P366 in order to develop an S1C63158 application. This register does not exist in the S1C63358. In the S1C6P336, this register functions as a general-purpose register.

### 6.1.7 Oscillation circuit

In the S1C6P366, only crystal oscillation is available for the OSC1 oscillation circuit and either ceramic or CR oscillation is available for the OSC3 oscillation circuit. The OSC1 CR oscillator option allowed in the S1C63358 cannot be selected.

Furthermore, pay attention to the difference on the oscillation start time according to the supply voltage. Be sure to have enough margin especially for stabilizing the OSC3 oscillation when controlling the peripheral circuit that uses the OSC3 clock.

### 6.1.8 SVD circuit

The S1C6P366 has a built-in SVD (supply voltage detection) circuit the same as the S1C63358. However, the detection levels are different from those of the S1C63358. Furthermore, there is a great restriction on the operable detection levels in the S1C6P366.

Table 6.1.8.1 Detection levels of SVD circuit

Detection level	S1C63358			S1C6P366		
	Min.	Typ.	Max.	Min.	Typ.	Max.
SVDS3-0 = "0"	0.95	1.05	1.15	Not allowed		
SVDS3-0 = "1"	1.02	1.10	1.18			
SVDS3-0 = "2"	1.07	1.15	1.23			
SVDS3-0 = "3"	1.12	1.20	1.28			
SVDS3-0 = "4"	1.16	1.25	1.34			
SVDS3-0 = "5"	1.21	1.30	1.39			
SVDS3-0 = "6"	1.30	1.40	1.50			
SVDS3-0 = "7"	1.49	1.60	1.71			
SVDS3-0 = "8"	1.81	1.95	2.09			
SVDS3-0 = "9"	1.86	2.00	2.14			
SVDS3-0 = "10"	1.91	2.05	2.19			
SVDS3-0 = "11"	1.95	2.10	2.25			
SVDS3-0 = "12"	2.05	2.20	2.35			
SVDS3-0 = "13"	2.14	2.30	2.46			
SVDS3-0 = "14"	2.33	2.50	2.68	2.50	2.70	2.90
SVDS3-0 = "15"	2.42	2.60	2.78	2.60	2.80	3.00

Be aware that the SVD circuit in the S1C6P366 does not operate properly if the SVDS register is set to 13 or less.

## 6.2 Differences from S1C63158

### 6.2.1 Terminal configuration

The design of the S1C6P366 is based on the S1C63358, therefore the terminal configuration and assignment are different from those of the S1C63158 (e.g., the S1C6P366 has LCD driver output terminals that do not exist in the S1C63158). Furthermore, PROM programming terminals are added to the S1C6P366.

## 6.2.2 Mask option

The S1C6P366 cannot specify the S1C63158 mask options individually.

The following option combination is provided for the S1C6P366.

Table 6.2.2.1 Combination of mask options

Mask option		S1C6P366E (Type E)	S1C6P366F (Type F)
OSC1 oscillation circuit		Crystal (32.768 kHz)	Crystal (32.768 kHz)
OSC3 oscillation circuit		Ceramic	CR

## 6.2.3 Power supply

### Supply voltage range

S1C6P366: 2.7 V to 5.5 V    S1C63158: 0.9 V to 3.6 V

The S1C6P366 cannot operate with less than 2.7 V supply voltage. Note that this difference affects the electrical characteristics.

### Operating mode of oscillation system voltage regulator and internal operating voltage

The oscillation system voltage regulator in the S1C63158 can operate in Vc2 mode (uses the Vc2 voltage generated by the voltage doubler) when the supply voltage is within the range of 0.9 V to 1.35 V. When the supply voltage is within the range of 1.35 V to 3.6 V, the oscillation system voltage regulator can operate in normal mode (uses the VDD supply voltage). Therefore, the S1C63158 needs to control the voltage doubler and operating mode according to the supply voltage using the DBON register (FF01H•D0) and the VDSEL register (FF01H•D2). Since the S1C6P366 does not operate with less than 2.7 V supply voltage, this switching is not necessary. Although the DBON and VDSEL registers are provided for developing the S1C63158 application, the register values do not affect the operating mode (fixed at normal mode).

The oscillation system voltage regulator generates the VD1 voltage for driving the oscillation circuit. The S1C63158 uses VD1 as the operating voltage of the internal logic circuits (CPU, PROM, RAM and peripheral digital circuits) as well. The VD1 voltage level must be switched using the VDC register (FF00H•D0) according to the oscillation circuit used and the supply voltage.

In the S1C6P366, this switching is not necessary because the VD1 voltage level is fixed at 2.05 V.

Furthermore, the VD1 voltage is used only for the OSC1 oscillation circuit, and the OSC3 oscillation circuit and other internal logic circuits operate with VDD as the source voltage. The VDC register value does not affect the VD1 voltage level (it does however, affect switching of the CPU clock).

Table 6.2.3.1 shows the operating mode of the oscillation system voltage regulator and the VD1 voltage value, and Table 6.2.3.2 shows the I/O map of the control registers.

Table 6.2.3.1 Operating mode of oscillation system voltage regulator and VD1

#### S1C63158

Power supply circuit	Operating condition	VD1 (V)	Supply voltage VDD (V)			
			0.9–1.35	1.35–2.2	2.2–3.6	3.6–5.5
Oscillation system voltage regulator	OSC1	1.3	Vc2 mode	Normal mode		Not allowed
	OSC3, 2 MHz	2.1	Not allowed		Normal mode	Not allowed

#### S1C6P366

Power supply circuit	Operating condition	VD1 (V)	Supply voltage VDD (V)

## LCD system voltage circuit

The S1C6P366 has a built-in LCD system voltage circuit that generates the LCD drive voltage. The S1C63158 does not contain this circuit.

## Operating mode of A/D converter power supply

The A/D converter in the S1C63158 can operate in Vc2 mode (uses the Vc2 voltage generated by the voltage doubler) when the supply voltage is within the range of 0.9 V to 2.2 V. When the supply voltage is within the range of 2.2 V to 3.6 V, the A/D converter can operate in normal mode (uses the VDD supply voltage). Therefore, the S1C63158 needs to control the voltage doubler and operating mode according to the supply voltage using the DBON register (FF01H•D0) and the VADSEL register (FF01H•D3). Since the S1C6P366 does not operate with less than 2.7 V supply voltage, this switching is not necessary. Although the DBON and VADSEL registers are provided for developing the S1C63158 application, the register value does not affect the operating mode (fixed at normal mode). Table 6.2.3.3 shows the operating mode of the A/D converter power supply, and Table 6.2.3.4 shows the I/O map of the control registers.

Table 6.2.3.3 Operating mode of A/D converter power supply

### S1C63158

		R/W	R	R/W	DBON	0	(On)	(Off)	(Voltage doubler On/Off)

## 6.2.4 Initial reset

When the power is turned on, the reset terminal must be set at Low level until the supply voltage rises to the Vsr level.

Fig. 6.2.4.1 Initial reset at power-on

The Vsr voltage level is different:

S1C63158: Vsr = 1.3 V

S1C6P366: Vsr = 2.7 V

Furthermore, S1C6P366 uses the initial reset signal as a trigger for setting either the normal operation mode or the programming mode. Therefore, design the reset input circuit so that the IC will be reset for sure. Initial resetting during operation is the same as the S1C63158. When resetting the IC in the normal operation mode, make sure to fix the  $\overline{\text{SPRG}}$  terminal at High level or leave open.

### 6.2.5 PROM, RAM

The S1C6P366 employs a Flash EEPROM for the internal PROM. The Flash EEPROM can be rewritten up to 100 times. Rewriting data is done at the user's own risk.

Table 6.2.5.1 lists the code PROM and RAM sizes of the S1C6P366 and the S1C63158.

Table 6.2.5.1 Memory size

Memory	S1C6P366	S1C63158
Code PROM	16,384 × 13 bits	8,192 × 13 bits
Data RAM	2,048 × 4 bits	512 × 4 bits

When developing an application for the S1C63158, pay attention to the memory size.

### 6.2.6 I/O memory

The LCD driver control registers (FF60H, FF61H) exist in the I/O memory of the S1C6P366 in order to develop a S1C63358 application. These registers do not exist in the S1C63158.

### 6.2.7 Oscillation circuit

In the S1C6P366, only crystal oscillation is available for the OSC1 oscillation circuit and either ceramic or CR oscillation is available for the OSC3 oscillation circuit. The OSC1 CR oscillator option allowed in the S1C63158 cannot be selected.

Furthermore, pay attention to the difference of the oscillation start time according to the supply voltage. Be sure to have enough margin especially for stabilizing the OSC3 oscillation when controlling the peripheral circuit that uses the OSC3 clock.

### 6.2.8 SVD circuit

The S1C6P366 has a built-in SVD (supply voltage detection) circuit the same as the S1C63158. However, the detection levels are different from those of the S1C63158. Furthermore, there is a great restriction on the operable detection levels in the S1C6P366.

Table 6.2.8.1 Detection levels of SVD circuit

Detection level	S1C63158			S1C6P366		
	Min.	Typ.	Max.	Min.	Typ.	Max.
SVDS3-0 = "0"	0.95	1.05	1.15	Not allowed		
SVDS3-0 = "1"	1.05	1.10	1.15			
SVDS3-0 = "2"	1.10	1.15	1.20			
SVDS3-0 = "3"	1.15	1.20	1.25			
SVDS3-0 = "4"	1.20	1.25	1.30			
SVDS3-0 = "5"	1.25	1.30	1.35			
SVDS3-0 = "6"	1.35	1.40	1.45			
SVDS3-0 = "7"	1.55	1.60	1.65			
SVDS3-0 = "8"	1.90	1.95	2.00			
SVDS3-0 = "9"	1.95	2.00	2.05			
SVDS3-0 = "10"	2.00	2.05	2.10			
SVDS3-0 = "11"	2.05	2.10	2.15			
SVDS3-0 = "12"	2.15	2.20	2.25			
SVDS3-0 = "13"	2.25	2.30	2.35			
SVDS3-0 = "14"	2.45	2.50	2.55	2.50	2.70	2.90
SVDS3-0 = "15"	2.55	2.60	2.65	2.60	2.80	3.00

Be aware that the SVD circuit in the S1C6P366 does not operate properly if the SVDS register is set to 13 or less.

## CHAPTER 7 SUMMARY OF NOTES

### 7.1 Notes for Low Current Consumption

The S1C6P366 contains control registers for each of the circuits so that current consumption can be reduced.

These control registers reduce the current consumption through programs that operate the circuits at the minimum levels.

The following lists the circuits that can control operation and their control registers. Refer to these when programming.

*Table 7.1.1 Circuits and control registers*

Circuit (and item)	Control register
CPU	HALT instruction
CPU operating frequency	CLKCHG, OSCC
LCD system voltage circuit	LPWR
SVD circuit	SVDON

Refer to Chapter 9, "Electrical Characteristics" for current consumption.

Below are the circuit statuses at initial reset.

**CPU:** Operating status

**CPU operating frequency:** Low speed side (CLKCHG = "0")

OSC3 oscillation circuit is in OFF status (OSCC = "0")

**LCD system voltage circuit:** OFF status (LPWR = "0")

**SVD circuit:** OFF status (SVDON = "0")

Also, be careful about panel selection because the current consumption can differ by the order of several  $\mu\text{A}$  on account of the LCD panel characteristics.

## 7.2 Summary of Notes by Function

---

Here, the cautionary notes are summed up by function category. Keep these notes well in mind when programming.

### Memory and stack

- (1) Memory is not implemented in unused areas within the memory map. Further, some non-implementation areas and unused (access prohibition) areas exist in the peripheral I/O area. If the program that accesses these areas is generated, its operation cannot be guaranteed. Refer to the I/O memory maps shown in Tables 4.1.1 (a)–(f) for the peripheral I/O area.
- (2) Part of the RAM area is used as a stack area for subroutine call and register evacuation, so pay attention not to overlap the data area and stack area.
- (3) The S1C63000 core CPU handles the stack using the stack pointer for 4-bit data (SP2) and the stack pointer for 16-bit data (SP1). 16-bit data are accessed in stack handling by SP1, therefore, this stack area should be allocated to the area where 4-bit/16-bit access is possible (0100H to 01FFH). The stack pointers SP1 and SP2 change cyclically within their respective range: the range of SP1 is 0000H to 03FFH and the range of SP2 is 0000H to 00FFH. Therefore, pay attention to the SP1 value because it may be set to 00FFH or less exceeding the 4-bit/16-bit accessible range in the S1C6P366. Memory accesses except for stack operations by SP1 are 4-bit data access.  
After initial reset, all the interrupts including NMI are masked until both the stack pointers SP1 and SP2 are set by software. Further, if either SP1 or SP2 is re-set when both are set already, the interrupts including NMI are masked again until the other is re-set. Therefore, the settings of SP1 and SP2 must be done as a pair.
- (4) The S1C6P366 has a built-in code PROM and RAM larger than those of the S1C63358 and the S1C63158. When using the S1C6P366 as a development tool of for the S1C63358/63158, pay attention to the memory size.

### Power supply and operating mode

Since the S1C6P366 operates with a 2.7 V or more supply voltage, the operating mode of the power supply circuit is fixed at normal mode. Although the operating mode control registers exist, they function as general-purpose registers. It is not necessary to switch the operating mode as with the S1C63358/63158. However, when using the S1C6P366 as a development tool for the S1C63358/63158, program the appropriate control sequence according to the model (refer to the "Technical Manual" of each model).

### Watchdog timer

- (1) When the watchdog timer is being used, the software must reset it within 3-second cycles.
- (2) Because the watchdog timer is set in operation state by initial reset, set the watchdog timer to disabled state (not used) before generating an interrupt (NMI) if it is not used.

### Oscillation circuit

- (1) It takes at least 5 msec from the time the OSC3 oscillation circuit goes ON until the oscillation stabilizes. Consequently, when switching the CPU operation clock from OSC1 to OSC3, do this after a minimum of 5 msec have elapsed since the OSC3 oscillation went ON. Further, the oscillation stabilization time varies depending on the external oscillator characteristics and conditions of use, so allow ample margin when setting the wait time.
- (2) When switching the clock form OSC3 to OSC1, use a separate instruction for switching the OSC3 oscillation OFF. An error in the CPU operation can result if this processing is performed at the same time by the one instruction.
- (3) In the S1C6P366, the VDC register value does not affect the VD1 voltage level. However, note that the CPU clock cannot be switched from OSC1 to OSC3 using the CLKCHG register if the VDC register value is "0". When using the S1C6P366 as a development tool for the S1C63358/63158, switch the operating voltage using the VDC register according to the control sequence of the model (refer to the "Technical Manual").

### Input port

- (1) When input ports are changed from low to high by pull-up resistors, the rise of the waveform is delayed on account of the time constant of the pull-up resistor and input gate capacitance. Hence, when fetching input ports, set an appropriate waiting time.  
Particular care needs to be taken of the key scan during key matrix configuration.  
Make this waiting time the amount of time or more calculated by the following expression.  

$$10 \times C \times R$$

C: terminal capacitance 5 pF + parasitic capacitance ? pF  
R: pull-up resistance 300 kΩ
- (2) The K13 terminal functions as the clock input terminal for the programmable timer, and the input signal is shared with the input port and the programmable timer. Therefore, when the K13 terminal is set to the clock input terminal for the programmable timer, take care of the interrupt setting.

### Output port

- (1) When using the output port (R02, R03) as the special output port, fix the data register (R02, R03) at "1" and the high impedance control register (R02HIZ, R03HIZ) at "0" (data output).  
Be aware that the output terminal is fixed at a low (Vss) level the same as the DC output if "0" is written to the R02 and R03 registers when the special output has been selected.  
Be aware that the output terminal shifts into high impedance status when "1" is written to the high impedance control register (R02HIZ, R03HIZ).
- (2) A hazard may occur when the FOUT signal and the TOUT signal are turned ON and OFF.
- (3) When fosc3 is selected for the FOUT signal frequency, it is necessary to control the OSC3 oscillation circuit before output. Refer to Section 4.3, "Oscillation Circuit", for the control and notes.

### I/O port

When in the input mode, I/O ports are changed from low to high by pull-up resistor, the rise of the waveform is delayed on account of the time constant of the pull-up resistor and input gate capacitance. Hence, when fetching input ports, set an appropriate wait time.  
Particular care needs to be taken of the key scan during key matrix configuration.  
Make this waiting time the amount of time or more calculated by the following expression.

$$10 \times C \times R$$

C: terminal capacitance 5 pF + parasitic capacitance ? pF

R: pull-up resistance 300 kΩ

### LCD driver

- (1) The contents of the display memory are undefined until the area is initialized (through, for instance, memory clear processing by the CPU). Initialize the display memory by executing initial processing.
- (2) 100 msec or more time is necessary for stabilizing the LCD drive voltages Vc1, Vc2 and Vc3 after setting the LCD power control register LPWR to "1". Be careful of the segment-on right after the power is turned on.

### Clock timer

Be sure to read timer data in the order of low-order data (TM0–TM3) then high-order data (TM4–TM7).

### Programmable timer

- (1) When reading counter data, be sure to read the low-order 4 bits (PTD00–PTD03, PTD10–PTD13) first. Furthermore, the high-order 4 bits (PTD04–PTD07, PTD14–PTD17) should be read within 0.73 msec of reading the low-order 4 bits (PTD00–PTD03, PTD10–PTD13).  
For the 16 bit × 1 mode, be sure to read as following sequence:  
 (PTD00–PTD03) → (PTD04–PTD07) → (PTD10–PTD13) → (PTD14–PTD17)  
 The read sequence time should be within 1.46 msec.

- (2) The programmable timer actually enters RUN/STOP status in synchronization with the falling edge of the input clock after writing to the PTRUN0/PTRUN1 register. Consequently, when "0" is written to the PTRUN0/PTRUN1 register, the timer enters STOP status at the point where the counter is decremented (-1). The PTRUN0/PTRUN1 register maintains "1" for reading until the timer actually stops. Figure 7.2.1 shows the timing chart for the RUN/STOP control.

Fig. 7.2.1 Timing chart for RUN/STOP control

It is the same even in the event counter mode. Therefore, be aware that the counter does not enter RUN/STOP status if a clock is not input after setting the RUN/STOP control register (PTRUN0).

- (3) Since the TOUT signal is generated asynchronously from the PTOUT register, a hazard within 1/2 cycle is generated when the signal is turned ON and OFF by setting the register.
- (4) When the OSC3 oscillation clock is selected for the clock source, it is necessary to turn the OSC3 oscillation ON, prior to using the programmable timer. However the OSC3 oscillation circuit requires a time interval of at least 5 msec from turning the circuit ON until the oscillation stabilizes. Therefore, allow an adequate interval from turning the OSC3 oscillation circuit ON to starting the programmable timer. Refer to Section 4.3, "Oscillation Circuit", for the control and notes of the OSC3 oscillation circuit. At initial reset, the OSC3 oscillation circuit is set in the OFF state.
- (5) For the reason below, pay attention to the reload data write timing when changing the interval of the programmable timer interrupts while the programmable timer is running. The programmable timer counts down at the falling edge of the input clock and at the same time it generates an interrupt if the counter underflows. Then it starts loading the reload data to the counter and the counter data is determined at the next rising edge of the input clock (period shown in as ① in the figure).

Fig. 7.2.2 Reload timing for programmable timer

To avoid improper reloading, do not rewrite the reload data after an interrupt occurs until the counter data is determined including the reloading period ①. Be especially careful when using the OSC1 (low-speed clock) as the clock source of the programmable timer and the CPU is operating with the OSC3 (high-speed clock).

## Serial interface

- (1) Perform data writing/reading to the data registers SD0–SD7 only while the serial interface is not running (i.e., the synchronous clock is neither being input or output).
- (2) As a trigger condition, it is required that data writing or reading on data registers SD0–SD7 be performed prior to writing "1" to SCTRG. (The internal circuit of the serial interface is initiated through data writing/reading on data registers SD0–SD7.) In addition, be sure to enable the serial interface with the ESIF register before setting the trigger.

Supply trigger only once every time the serial interface is placed in the RUN state. Refrain from performing trigger input multiple times, as leads to malfunctioning. Moreover, when the synchronous clock SCLK is external clock, start to input the external clock after the trigger.

- (3) Setting of the input/output permutation (MSB first/LSB first) with the SDP register should be done before setting data to SD0–SD7.
- (4) Be aware that the maximum clock frequency for the serial interface is limited to 1 MHz when OSC3 is used as the clock source of the programmable timer or in the slave mode.

### A/D converter

- (1) The A/D converter can operate by inputting the clock from the clock selector. Therefore, it is necessary to select the clock source and to turn the clock output on before starting A/D conversion. Furthermore, it is also necessary that the OSC3 oscillation circuit is operating when using the OSC3 clock.
- (2) When using the OSC3 clock as the A/D conversion clock, do not stop the OSC3 oscillation circuit during A/D conversion. If the OSC3 oscillation circuit stops, correct A/D conversion result cannot be obtained.
- (3) The input clock and analog input terminals should be set when the A/D converter stops. Changing these settings in the A/D converter operation may cause errors.
- (4) To prevent malfunction, do not start A/D conversion (writing "1" to the ADRUN register) when the A/D conversion clock is not being output from the clock selector, and do not turn the clock off during A/D conversion.
- (5) If the CHS register selects an input channel which is not included in the analog input terminals set by the PAD register (the PAD register can select several terminals simultaneously), the A/D conversion does not result in a correct converted value.
- (6) During A/D conversion, do not operate the P4n terminals which are not used for analog inputs of the A/D converter (for input/output of digital signals). It affects the A/D conversion precision.
- (7) In the S1C6P366, the value set in the VADSEL register does not affect the operating mode (operating voltage) of the A/D converter. However, when using the S1C6P366 as a development tool for the S1C63358/63158, control the operating voltage using the VADSEL register according to the control sequence of the model (refer to the "Technical Manual").

### Buzzer output circuit

Since it generates a buzzer signal that is out of synchronization with the BZON register, hazards may at times be produced when the signal goes ON/OFF due to the setting of the BZON register.

### SVD circuit

- (1) To obtain a stable detection result, the SVD circuit must be ON for at least 100  $\mu$ sec. So, to obtain the SVD detection result, follow the programming sequence below.
  1. Set SVDON to "1"
  2. Maintain for 100  $\mu$ sec minimum
  3. Set SVDON to "0"
  4. Read SVDDT
- (2) The SVD circuit should normally be turned OFF because SVD operation increase current consumption.
- (3) Be aware that the SVD circuit in the S1C6P366 does not operate properly if the SVDS register is set to 13 or less, the SVD operation cannot be guaranteed since the lower limit of the operating voltage is 2.7 V.

### Interrupt

- (1) The interrupt factor flags are set when the interrupt condition is established, even if the interrupt mask registers are set to "0".
- (2) After an interrupt occurs, the same interrupt will occur again if the interrupt enabled state (I flag = "1") is set or the RETI instruction is executed unless the interrupt factor flag is reset. Therefore, be sure to reset (write "1" to) the interrupt factor flag in the interrupt service routine before shifting to the interrupt enabled state.

- (3) After an initial reset, all the interrupts including NMI are masked until both the stack pointers SP1 and SP2 are set with the software. Be sure to set the SP1 and SP2 in the initialize routine.  
Further, when re-setting the stack pointer, the SP1 and SP2 must be set as a pair. When one of them is set, all the interrupts including NMI are masked and interrupts cannot be accepted until the other one is set.

### Flash EEPROM

- (1) Inspection data is written to the PROM at shipment. Therefore, it must be programmed before operating the IC in the normal operation mode (refer to Appendix A).
- (2) Recommended LCD segment option data is include in the S5U1C6P366Y1 package. Modifying the LCD segment opotion is done at the user's own risk.
- (3) The Flash EEPROM data can be rewritten up to 100 times for both the code and segment option PROMs.  
Rewriting data is done at the user's own risk.

## 7.3 Precautions on Mounting

### <Oscillation Circuit>

- Oscillation characteristics change depending on conditions (board pattern, components used, etc.). In particular, when a ceramic oscillator or crystal oscillator is used, use the oscillator manufacturer's recommended values for constants such as capacitance and resistance.
- Disturbances of the oscillation clock due to noise may cause a malfunction. Consider the following points to prevent this:
  - (1) Components which are connected to the OSC1, OSC2, OSC3 and OSC4 terminals, such as oscillators, resistors and capacitors, should be connected in the shortest line.
  - (2) As shown in the right hand figure, make a Vss pattern as large as possible at circumscription of the OSC1, OSC2, OSC3 and OSC4 terminals and the components connected to these terminals. Furthermore, do not use this Vss pattern for any purpose other than the oscillation system.
- In order to prevent unstable operation of the oscillation circuit due to current leak between OSC1/OSC3 and VDD, please keep enough distance between OSC1/OSC3 and VDD or other signals on the board pattern.

### <Reset Circuit>

- The power-on reset signal which is input to the  $\overline{\text{RESET}}$  terminal changes depending on conditions (power rise time, components used, board pattern, etc.). Decide the time constant of the capacitor and resistor after enough tests have been completed with the application product. When the built-in pull-up resistor is added to the  $\overline{\text{RESET}}$  terminal by mask option, take into consideration dispersion of the resistance for setting the constant.
- In order to prevent any occurrences of unnecessary resetting caused by noise during operating, components such as capacitors and resistors should be connected to the  $\overline{\text{RESET}}$  terminal in the shortest line.

### <Power Supply Circuit>

- Sudden power supply variation due to noise may cause malfunction. Consider the following points to prevent this:
  - (1) The power supply should be connected to the VDD, VSS, AVDD, AVSS and AVREF terminal with patterns as short and large as possible. In particular, the power supply for AVDD, AVSS and AVREF affects A/D conversion precision.
  - (2) When connecting between the VDD and VSS terminals with a bypass capacitor, the terminals should be connected as short as possible.

- (3) Components which are connected to the VD1, VC1-VC3 terminals, such as capacitors and resistors, should be connected in the shortest line. In particular, the VC1-VC3 voltages affect the display quality.
- Do not connect anything to the VC1-VC3 terminals when the LCD driver is not used.

**<A/D Converter>**

- When the A/D converter is not used, the power supply terminals for the analog system should be connected as shown below.

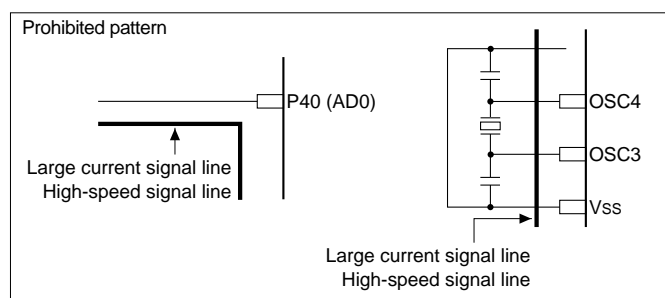

AVDD → VDD

AVSS → VSS

AVREF → VSS

**<Arrangement of Signal Lines>**

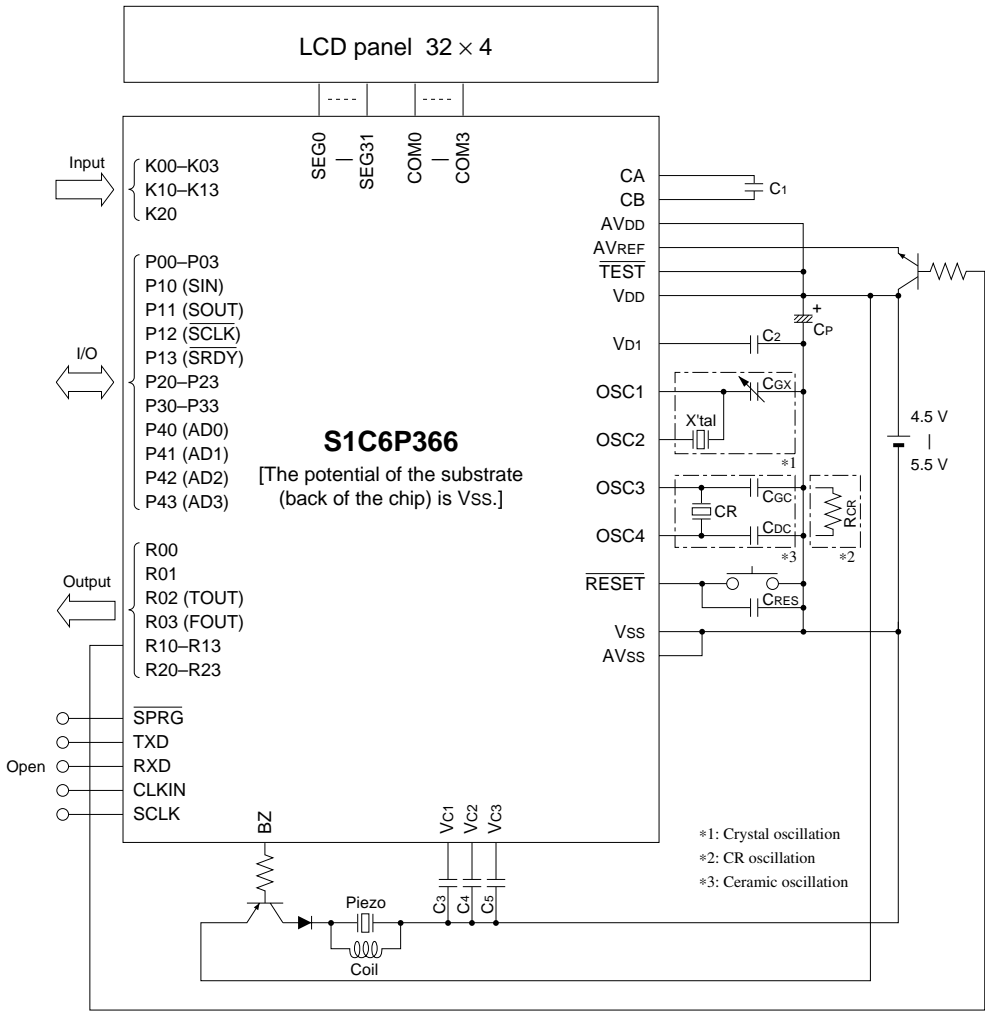

- In order to prevent generation of electromagnetic induction noise caused by mutual inductance, do not arrange a large current signal line near the circuits that are sensitive to noise such as the oscillation unit and analog input unit.
- When a signal line is parallel with a high-speed line in long distance or intersects a high-speed line, noise may generated by mutual interference between the signals and it may cause a malfunction. Do not arrange a high-speed signal line especially near circuits that are sensitive to noise such as the oscillation unit and analog input unit.

**<Precautions for Visible Radiation (when bare chip is mounted)>**

- Visible radiation causes semiconductor devices to change the electrical characteristics. It may cause this IC to malfunction. When developing products which use this IC, consider the following precautions to prevent malfunctions caused by visible radiations.
  - (1) Design the product and implement the IC on the board so that it is shielded from visible radiation in actual use.
  - (2) The inspection process of the product needs an environment that shields the IC from visible radiation.
  - (3) As well as the face of the IC, shield the back and side too.

# CHAPTER 8 BASIC EXTERNAL WIRING DIAGRAM

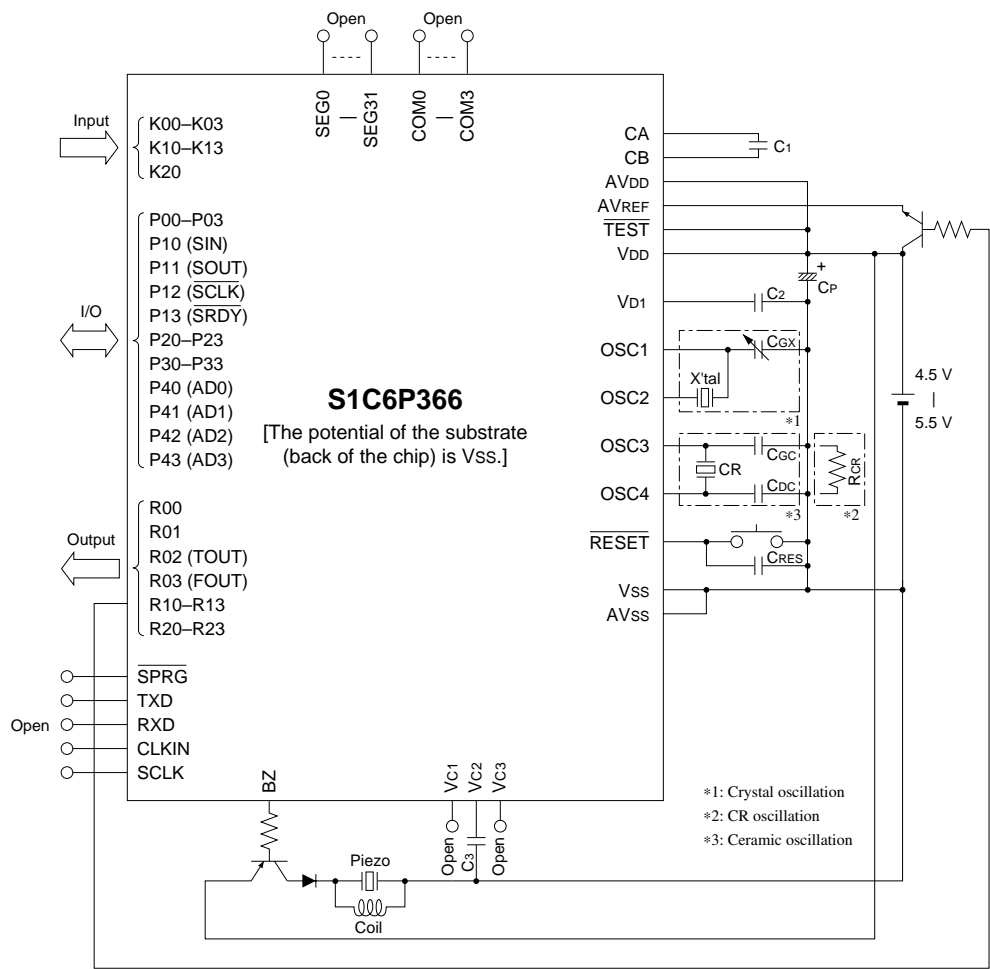

• Normal operating mode <when used as S1C63358 OTP>

X'tal	Crystal oscillator	32.768 kHz, C1 (Max.) = 34 kΩ

## CHAPTER 9 ELECTRICAL CHARACTERISTICS

*Note: The electrical characteristics of the S1C6P366 are different from those of the S1C63358/63158. The following characteristic values should be used as reference values when the S1C6P366 is used as a development tool.*

### 9.1 Absolute Maximum Rating

(V <sub>SS</sub> =0V)			
Item	Symbol	Rated value	Unit
Supply voltage	V <sub>DD</sub>	-0.5 to 7.0	V
Input voltage (1)	V <sub>I</sub>	-0.5 to V <sub>DD</sub> + 0.3	V
Input voltage (2)	V <sub>IOSC</sub>	-0.5 to V <sub>D1</sub> + 0.3	V
Permissible total output current *1	ΣI <sub>VDD</sub>	10	mA
Operating temperature	T <sub>opr</sub>	-20 to 70	°C
Storage temperature *2	T <sub>stg</sub>	-65 to 150	°C
Soldering temperature / time	T <sub>sol</sub>	260°C, 10sec (lead section)	—
Permissible dissipation *3	P <sub>D</sub>	250	mW

\*1 The permissible total output current is the sum total of the current (average current) that simultaneously flows from the output pin (or is drawn in).

\*2 The storage temperature cannot guarantee data holding capability.

\*3 In case of plastic package (QFP15-100pin).

### 9.2 Recommended Operating Conditions

(Ta=-20 to 70°C)							
Item	Symbol	Condition		Min.	Typ.	Max.	Unit
Supply voltage	VDD	VSS=0V	Normal mode	2.7	3.0	5.5	V
	AVDD	AVSS=0V		2.7	3.0	5.5	V
Oscillation frequency	fOSC1	Crystal oscillation		—	32.768	—	kHz
	fOSC3	CR oscillation			1800		kHz
		Ceramic oscillation				4100	kHz

### 9.3 DC Characteristics

Unless otherwise specified:

$V_{DD}=3.0V$ ,  $V_{SS}=0V$ ,  $f_{OSC1}=32.768kHz$ ,  $T_a=25^{\circ}C$ ,  $V_{D1}/V_{C1}/V_{C2}/V_{C3}$  are internal voltage,  $C_1-C_5=0.2\mu F$

Item	Symbol	Condition	Min.	Typ.	Max.	Unit
High level input voltage (1)	$V_{IH1}$	K00-03, K10-13, K20, P00-03 P10-13, P20-23, P30-33, P40-43 RXD, SCLK, CLKIN, $\overline{SPRG}$	$0.8 \cdot V_{DD}$		$V_{DD}$	V

		SVDS0-3="13"	—	—	—	
		SVDS0-3="14"	2.50	2.70	2.90	
		SVDS0-3="15"	2.60	2.80	3.00	
SVD circuit response time	$t_{SVD}$				100	$\mu s$
Current consumption	$I_{OP}$	During HALT Normal mode LCD power OFF	32.768kHz	2.5	6	$\mu A$
		During HALT Normal mode *1 LCD power ON	32.768kHz	37	60	$\mu A$
		During execution Normal mode *1	32.768kHz (Crystal oscillation) 1.8MHz (CR oscillation)	120 0.6	200 0.9	$\mu A$ mA
		LCD power ON	4MHz (Ceramic oscillation)	0.8	1.2	mA

\*1 Without panel load. The SVD circuit and the A/D converter are OFF.  $AV_{REF}$  is open.

### A/D converter characteristic

Unless otherwise specified:

$AV_{DD}=V_{DD}=2.7$  to  $3.6V$ ,  $AV_{SS}=V_{SS}=0V$ ,  $T_a=-25$  to  $75^{\circ}C$

Item	Symbol	Condition	Min.	Typ.	Max.	Unit
Resolution			8	8	8	bit
Error		$3.6V \leq V_{DD} \leq 5.5V$ $F_{conv}=OSC3/2$ or $OSC1$	-3		3	LSB
		$2.7V \leq V_{DD} \leq 3.6V$ $F_{conv}=OSC3/2$ or $OSC1$	-3		3	LSB
Conversion time	$t_{conv}$	$F_{conv}=OSC3/2=2MHz$			10.5	$\mu s$
		$F_{conv}=OSC1=32kHz$			641	$\mu s$
Input voltage			$AV_{SS}$		$AV_{REF}$	V
Reference voltage	$AV_{REF}$		0.9		$AV_{DD}$	V
$AV_{REF}$ resistance			15	50		$k\Omega$

## 9.5 Oscillation Characteristics

The oscillation characteristics change depending on the conditions (components used, board pattern, etc.). Use the following characteristics as reference values.

### OSC1 crystal oscillation circuit

Unless otherwise specified:

$V_{DD}=3.0V$ ,  $V_{SS}=0V$ ,  $f_{OSC1}=32.768kHz$ ,  $C_G=25pF$ ,  $C_D=$ built-in,  $T_a=-20$  to  $70^{\circ}C$

Item	Symbol	Condition	Min.	Typ.	Max.	Unit
Oscillation start voltage	$V_{sta}$	$t_{sta} \leq 3sec$ ( $V_{DD}$ )	2.7			V
Oscillation stop voltage	$V_{stp}$	$t_{stp} \leq 10sec$ ( $V_{DD}$ )	2.7			V
Built-in capacitance (drain)	$C_D$	Including the parasitic capacitance inside the IC (in chip)		18		pF
Frequency/voltage deviation	$\partial f/\partial V$	$V_{DD}=2.7$ to $5.5V$			5	ppm
Frequency/IC deviation	$\partial f/\partial IC$		-10		10	ppm
Frequency adjustment range	$\partial f/\partial C_G$	$C_G=5$ to $25pF$		50		ppm
Harmonic oscillation start voltage	$V_{hho}$	$C_G=5pF$ ( $V_{DD}$ )	5.5			V
Permitted leak resistance	$R_{leak}$	Between OSC1 and $V_{DD}$ , $V_{SS}$	200			$M\Omega$

### OSC3 ceramic oscillation circuit

Unless otherwise specified:

$V_{DD}=3.0V$ ,  $V_{SS}=0V$ , Ceramic oscillator: 4MHz,  $C_{GC}=C_{DC}=100pF$ ,  $T_a=-20$  to  $70^{\circ}C$

Item	Symbol	Condition	Min.	Typ.	Max.	Unit
Oscillation start voltage	$V_{sta}$	Normal mode ( $V_{DD}$ )	2.7			V
Oscillation start time	$t_{sta}$	$V_{DD}=2.7$ to $5.5V$			5	ms
Oscillation stop voltage	$V_{stp}$	Normal mode ( $V_{DD}$ )	2.7			V

### OSC3 CR oscillation circuit

Unless otherwise specified:

$V_{DD}=3.0V$ ,  $V_{SS}=0V$ ,  $R_{CR}=91k\Omega$ ,  $T_a=25^{\circ}C$

Item	Symbol	Condition	Min.	Typ.	Max.	Unit
Oscillation frequency dispersion	$f_{OSC3}$		-30	1.8MHz	30	%
Oscillation start voltage	$V_{sta}$	Normal mode ( $V_{DD}$ )	2.7			V
Oscillation start time	$t_{sta}$	$V_{DD}=2.7$ to $5.5V$			3	ms
Oscillation stop voltage	$V_{stp}$	Normal mode ( $V_{DD}$ )	2.7			V

### OSC3 CR oscillation frequency-resistance characteristic

The oscillation characteristics change depending on the conditions (components used, board pattern, etc.). Use the following characteristics as reference values and evaluate the characteristics on the actual product.

## 9.6 Serial Interface AC Characteristics

### Clock synchronous master mode

#### • During 32 kHz operation

Condition:  $V_{DD}=3.0V$ ,  $V_{SS}=0V$ ,  $T_a=25^{\circ}C$ ,  $V_{IH1}=0.8V_{DD}$ ,  $V_{IL1}=0.2V_{DD}$ ,  $V_{OH}=0.8V_{DD}$ ,  $V_{OL}=0.2V_{DD}$

Item	Symbol	Min.	Typ.	Max.	Unit
Transmitting data output delay time	t <sub>smd</sub>			5	μs
Receiving data input set-up time	t <sub>sms</sub>	10			μs
Receiving data input hold time	t <sub>smh</sub>	5			μs

#### • During 1 MHz operation

Condition:  $V_{DD}=3.0V$ ,  $V_{SS}=0V$ ,  $T_a=25^{\circ}C$ ,  $V_{IH1}=0.8V_{DD}$ ,  $V_{IL1}=0.2V_{DD}$ ,  $V_{OH}=0.8V_{DD}$ ,  $V_{OL}=0.2V_{DD}$

Item	Symbol	Min.	Typ.	Max.	Unit
Transmitting data output delay time	t <sub>smd</sub>			200	ns
Receiving data input set-up time	t <sub>sms</sub>	400			ns
Receiving data input hold time	t <sub>smh</sub>	200			ns

### Clock synchronous slave mode

#### • During 32 kHz operation

Condition:  $V_{DD}=3.0V$ ,  $V_{SS}=0V$ ,  $T_a=25^{\circ}C$ ,  $V_{IH1}=0.8V_{DD}$ ,  $V_{IL1}=0.2V_{DD}$ ,  $V_{OH}=0.8V_{DD}$ ,  $V_{OL}=0.2V_{DD}$

Item	Symbol	Min.	Typ.	Max.	Unit
Transmitting data output delay time	t <sub>ssd</sub>			10	μs
Receiving data input set-up time	t <sub>sss</sub>	10			μs
Receiving data input hold time	t <sub>ssh</sub>	5			μs

#### • During 1 MHz operation

Condition:  $V_{DD}=3.0V$ ,  $V_{SS}=0V$ ,  $T_a=25^{\circ}C$ ,  $V_{IH1}=0.8V_{DD}$ ,  $V_{IL1}=0.2V_{DD}$ ,  $V_{OH}=0.8V_{DD}$ ,  $V_{OL}=0.2V_{DD}$

Item	Symbol	Min.	Typ.	Max.	Unit
Transmitting data output delay time	t <sub>ssd</sub>			500	ns
Receiving data input set-up time	t <sub>sss</sub>	400			ns
Receiving data input hold time	t <sub>ssh</sub>	200			ns

<Master mode>

<Slave mode>

## 9.7 Timing Chart

### System clock switching

In the S1C6P366, the VDC register value does not affect the V<sub>D1</sub> voltage level. However, note that the CPU clock cannot be switched from OSC1 to OSC3 using the CLKCHG register if the VDC register value is "0".

Set the VDC register to "1" before switching the CPU clock from OSC1 to OSC3 in the S1C6P366.

When using the S1C6P366 as a development tool for the S1C63358/63158, switch the operating voltage using the VDC register according to the control sequence of the model (refer to the "Technical Manual").

## 9.8 Characteristics Curves (reference value)

### High level output current (Rxx, Pxx, BZ, Typ. value)

OSC1: 32.768kHz crystal oscillation,  $V_{SS} = 0V$ , no panel load,  $C_{GX} = 25pF$ ,  $C_{GC} = C_{DC} = 100pF$ ,  $C_1-C_5 = 0.2\mu F$

This graph is provided only for reference and the characteristic varies according to mounting conditions, parts used and the measurement environment.

The output terminals should be used within the rated value of permissible total output current.

### Low level output current (Rxx, Pxx, BZ, Typ. value)

OSC1: 32.768kHz crystal oscillation,  $V_{SS} = 0V$ , no panel load,  $C_{GX} = 25pF$ ,  $C_{GC} = C_{DC} = 100pF$ ,  $C_1-C_5 = 0.2\mu F$

This graph is provided only for reference and the characteristic varies according to mounting conditions, parts used and the measurement environment.

The output terminals should be used within the rated value of permissible total output current.

**Vc2 output voltage-temperature characteristic (Typ. value)**

OSC1: 32.768kHz crystal oscillation,  $V_{DD} = 3V$ ,  $V_{SS} = 0V$ , no panel load,  $C_{GX} = 25pF$ ,  $C_{GC} = C_{DC} = 100pF$ ,  $C_1-C_5 = 0.2\mu F$

The LCD drive voltage output from the internal LCD drive power circuit varies depending on temperature. This graph is provided only for reference and the characteristic varies according to mounting conditions, parts used and the measurement environment.

**Vc2 output voltage-supply voltage characteristic (Typ. value)**

OSC1: 32.768kHz crystal oscillation,  $T_a = 25^\circ C$ ,  $V_{SS} = 0V$ , no panel load,  $C_{GX} = 25pF$ ,  $C_{GC} = C_{DC} = 100pF$ ,  $C_1-C_5 = 0.2\mu F$

This graph is provided only for reference and the characteristic varies according to mounting conditions, parts used and the measurement environment.

**Power current-supply voltage characteristic (HALT state)**

OSC1: 32.768kHz crystal oscillation,  $T_a = 25^\circ C$ ,  $V_{SS} = 0V$ , no panel load,  $C_{GX} = 25pF$ ,  $C_{GC} = C_{DC} = 100pF$   
 This graph is provided only for reference and the characteristic varies according to mounting conditions, parts used and the measurement environment.

Power current-supply voltage characteristic (RUN state with OSC1 clock)

OSC1: 32.768kHz crystal oscillation, Ta =25°C, Vss = 0V, no panel load, CGx = 25pF, CGC = Cbc = 100pF  
This graph is provided only for reference and the characteristic varies according to mounting conditions, parts used and the measurement environment.

Power current-supply voltage characteristic (RUN state with OSC3 clock)

OSC1: 32.768kHz crystal oscillation, Ta =25°C, Vss = 0V, no panel load, CGx = 25pF, CGC = Cbc = 100pF  
This graph is provided only for reference and the characteristic varies according to mounting conditions, parts used and the measurement environment.

# CHAPTER 10 PACKAGE

## 10.1 Plastic Package

QFP15-100pin

(Unit: mm)

The dimensions are subject to change without notice.

# CHAPTER 11 PAD LAYOUT

## 11.1 Diagram of Pad Layout

Chip thickness: 400 μm  
Pad opening: 98 μm

## 11.2 Pad Coordinates

Unit:  $\mu\text{m}$

No.	Pad name	X	Y	No.	Pad name	X	Y	No.	Pad name	X	Y

# APPENDIX A PROM PROGRAMMING

## A.1 Outline of Writing Tools

---

The following tools are provided for writing user data to the Flash EEPROM built into the S1C6P366. Select one according to the development environment.

### (1) Serial programming (S1C88/S1C63 Serial Connector)

System environment

- Universal ROM Writer II (product name: S5U1C88000W1)
- S1C88/S1C63 Serial Connector (product name: S5U1C88000X1)
- Control Software (product name: S5U1C6P366Y1)

The S5U1C88000W1 with S5U1C88000X1 connected to a personal computer allows on-board programming for the S1C6P366. S5U1C88000W1 supplies the power voltage to the target board and sets up the programming mode via S5U1C88000X1.

### (2) Parallel programming (S1C6P366 Adapter Socket)

System environment

- Universal ROM Writer II (product name: S5U1C88000W1)
- S1C6P366 Adapter Socket (product name: S5U1C6P366X1)
- Control Software (product name: S5U1C6P366Y1)

The S5U1C88000W1 with S5U1C6P366X1 connected to a personal computer allows high-speed programming for packaged devices before mounting on boards.

\* The following explanations use the appellations listed below instead of the product names.

S5U1C88000W1 → Universal Writer

S5U1C88000X1 → S1C88/S1C63 Serial Connector

S5U1C6P366X1 → S1C6P366 Adapter Socket

S5U1C6P366Y1 → Control Software

\* The control software is included in the S5U1C63000A (Assembler Package).

## A.2 Serial Programming (S1C88/S1C63 Serial Connector)

### A.2.1 Serial programming environment (S1C88/S1C63 Serial Connector)

Prepare a personal computer system as a host computer, the exclusive PROM writing tools and the data for writing into the built-in Flash microcomputer.

#### (1) Personal computer

- IBM-PC/AT or compatible with a serial port (RS-232C)

#### (2) OS

- Windows95/98, English or Japanese version

#### (3) PROM writing tools

- S5U1C88000W1 package
- S5U1C88000X1 package
- S5U1C6P366Y1 package

#### (4) User data (ROM data HEX file)

##### *Executing HEX63xxx*

Execute the HEX63xxx HEX Converter to create the ROM data HEX files (C3xxxxyy.HSA, C3xxxxyy.LSA) from the object file (C3xxxxyy.ABS).

Refer to the "S5U1C63000A Manual" for details of the HEX Converter.

Fig. A.2.1.1 HEX63xxx execution flow

##### *Executing segment option data converter*

Execute the SDCP366 to create the segment option PROM HEX data file (C3xxxxyy.OSA) from a segment option document file (C3xxxxyy.SDC).

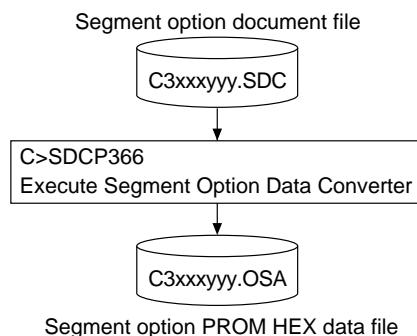

Fig. A.2.1.2 Segment option data converter execution flow

Copy the "SDCP366.EXE" to the current directory.

```
C>SDCP366
```

When the above command is executed, the message shown below appears on the screen for entering a segment option document file name.

```
*** Please input SOG document file name ***  
Input File Name == c3xxxxyy.sdc
```

Next, enter an output file name.

```
*** Please output SOG HEX file name ***  
Output File Name == cpxxxxyy.osa
```

The following message is displayed after the segment option PROM HEX file (CPxxxxyy.OSA) is generated.

```
Making file is completed
```

Close the MS-DOS prompt window.

The S5U1C6P366Y1 package contains the following files:

- SDCP366.EXE (Segment Option Data Converter executable file)
- CP366SEG.SDC (Recommended segment option document file)
- CP366SEG.OSA (Recommended segment option PROM HEX data file)

Refer to Section 4.7.4 "Segment option", for recommended segment option.

### A.2.2 System connection and setup for serial programming (S1C88/S1C63 Serial Connector)

Connect the Universal Writer to the personal computer and install the S1C88/S1C63 Serial Connector to the Universal Writer.

Fig. A.2.2.1 System connection diagram

The system should be connected according to the following procedure.

- (1) Confirmation of power off status  
Make sure the power for the personal computer and the Universal Writer is switched off.
- (2) Connecting the power cable  
A dedicated power cable is included in the Universal Writer package. Connect the power cable to the AC IN connector on the rear panel of the Universal Writer.
- (3) Connecting the RS-232C cable  
Connect the Universal Writer and personal computer using the supplied RS-232C cable. The RS-232C cable is for IBM-PC/AT use (9 pins - 9 pins).

*Note:* Secure the RS-232C cable with the connector screws to prevent malfunction.

- (4) Installing the S1C88/S1C63 Serial Connector  
Install the S1C88/S1C63 Serial Connector to the top connector of the Universal Writer. There is a projection on the S1C88/S1C63 Serial Connector to prevent improper insertion. Line up the S1C88/S1C63 Serial Connector to fit to the notch of the Universal Writer connector.

*Note:* When disconnecting the S1C88/S1C63 Serial Connector, make sure the power for the Universal Writer is off.

- (5) Selecting the program voltage  
Select 5 V program-voltage using the 5V/3V switch on the S1C88/S1C63 Serial Connector.

- (6) Confirmation of DIP switch status  
Check to see that the DIP switch (DSW) located at the back panel of the Universal Writer has been set as in Figure A.2.2.2 (factory setting).

*Note:* Set SW1 and SW2 up, and SW3 to SW8 down.

Fig. A.2.2.2 DIP switch settings

### A.2.3 Serial programming procedure (S1C88/S1C63 Serial Connector)

(1) Connecting the system

Connect the system as shown in Section A.2.2, "System connection and setup for serial programming (S1C88/S1C63 Serial Connector)".

(2) Power on

Turn the personal computer on then the Universal Writer (POWER SW is located on the side panel).

(3) Checking the serial port configuration

Check to see that the serial port is assigned to COM1 in the personal computer.

(4) Preparing the Control Software and user data

Copy the following files included in the S5U1C6P366Y1 package to a folder on a hard disk drive. (The following examples assume that the files have been copied to the "C:\URW2" folder.)

S5U1C6P366Y1 package
RW63P366.EXE (English/Japanese version)
63P366.FRM

Then copy the user data (ROM data HEX file) to the same folder as above.

*Note: Be aware that the Control Software may not run normally if it is located in a folder that has a name with a space included (e.g. My Documents).*

(5) Starting up the Control Software

There are two methods to start up the control software.

- Execute the following command on the MS-DOS prompt window.

```
C:\URW2>RW63P366
```

- Double-click the RW63P366.EXE icon.

When the control software starts up, the following message is displayed.

```
UNIVERSAL ROM WRITER      Ver. 3.xx
(C)COPYRIGHT 200x SEIKO EPSON CORPORATION

LOADING 63P366 FIRMWARE PROGRAM Ver. 3.xx
.....
```

After displaying the message, a prompt as below is displayed.

```
63P366:
```

(6) Loading user data

Enter as below to load the code PROM HEX files (CP366xxx.HSA, CP366xxx.LSA).

```
63P366:LI CP366xxx
```

Enter as below to load the segment option PROM HEX file (CP366xxx.OSA).

```
63P366:LO CP366xxx
```

The S5U1C6P366Y1 package contains the recommended segment option PROM HEX data (CP366SEG.OSA).

## (7) Connecting the target board

Connect the target board to the S1C88/S1C63 Serial Connector.

Refer to Section A.2.4, "Connection diagram for serial programming (S1C88/S1C63 Serial Connector)", for connection.

*Note: Do not turn on the power of the target board since the PROM programming power (5 V) is supplied from the Universal Writer.*

## (8) Erasing PROM

Clear (erase) the contents of the PROM (code PROM and segment option PROM) and perform erase check using the following command.

```
63P366:FERSA /E
```

"ERASE COMPLETED" is displayed when erasing has finished normally.

In a sample chip in which the PROM has not been protected, the code PROM and segment option PROM can be erased individually using the FERSI and FERSC commands, respectively. Refer to Section A.4.2, "Detailed description of the Universal ROM Writer II commands", for details.

*Notes:*

- Inspection data is written to the PROM at shipment, so erase it once to initialize the contents.

- The PROM is protected when user data is written at Seiko Epson's factory. The protection is released after the contents have been erased by the FERSA command.

## (9) Writing user data

Write code PROM data and verify the written data using the following command.

```
63P366:FWI /V
```

"WRITE COMPLETED" is displayed when writing has finished normally.

Then, write segment option PROM data and verify the written data using the following command.

```
63P366:FWC /V
```

"WRITE COMPLETED" is displayed when writing has finished normally.

## (10) Disconnecting the target board

Disconnect the target board after checking that writing has finished normally. To continue writing, repeat from step (7) to step (10).

*Note: Do not disconnect the target board when the READY LED on the S1C88/S1C63 Serial Connector is not lit.*

## (11) Terminating the Control Software

Execute the QUIT command to terminate the control software.

```
63P366:Q
```

*Note: Restarting the control software after it has been terminated without the QUIT command, for instance the MS-DOS prompt window is closed, may cause an error such as "RAM CLEAR ERROR". In this case, turn the Universal Writer off once and then turn on before starting up the control software.*

## (12) Power off

Turn the Universal Writer off (POWER SW is located on the side panel) then the personal computer.

A.2.4 Connection diagram for serial programming (S1C88/S1C63 Serial Connector)

Connecting to target board

Figure A.2.4.1 shows the connection on the target board and Table A.2.4.1 lists the signal specifications.

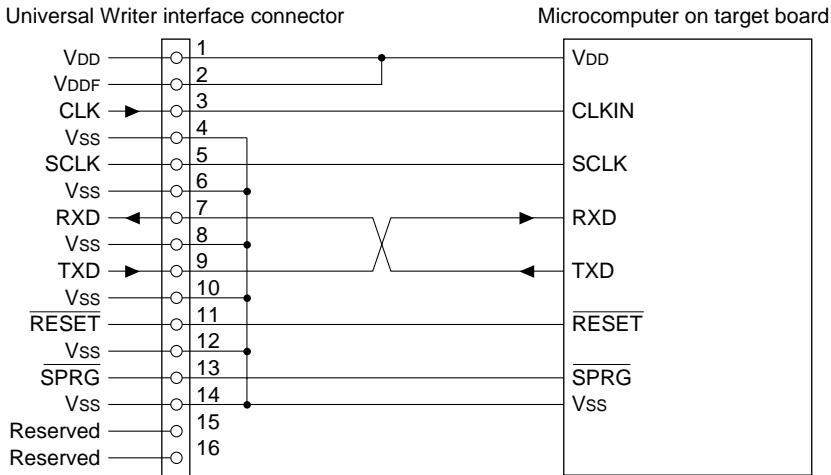

Fig. A.2.4.1 Connection diagram for serial programming (S1C88/S1C63 Serial Connector)

Table A.2.4.1 Signal specifications

Connector pin No.	Signal name	Description	Microcomputer pin to be connected
1	VDD	Power supply pin	VDD pin
2	VDDF	Programming power supply pin	VDD pin
3	CLK	System clock output	CLKIN pin
5	SCLK	Serial I/F clock output	N.C.
7	RXD	Serial I/F data input	TXD pin
9	TXD	Serial I/F data output	RXD pin
11	RESET	Initial reset output	RESET pin
13	SPRG	Programming mode setup output	SPRG pin
15	Reserved		N.C.
16	Reserved		N.C.
4, 6, 8, 10, 12, 14	Vss	Ground pin	Vss pin

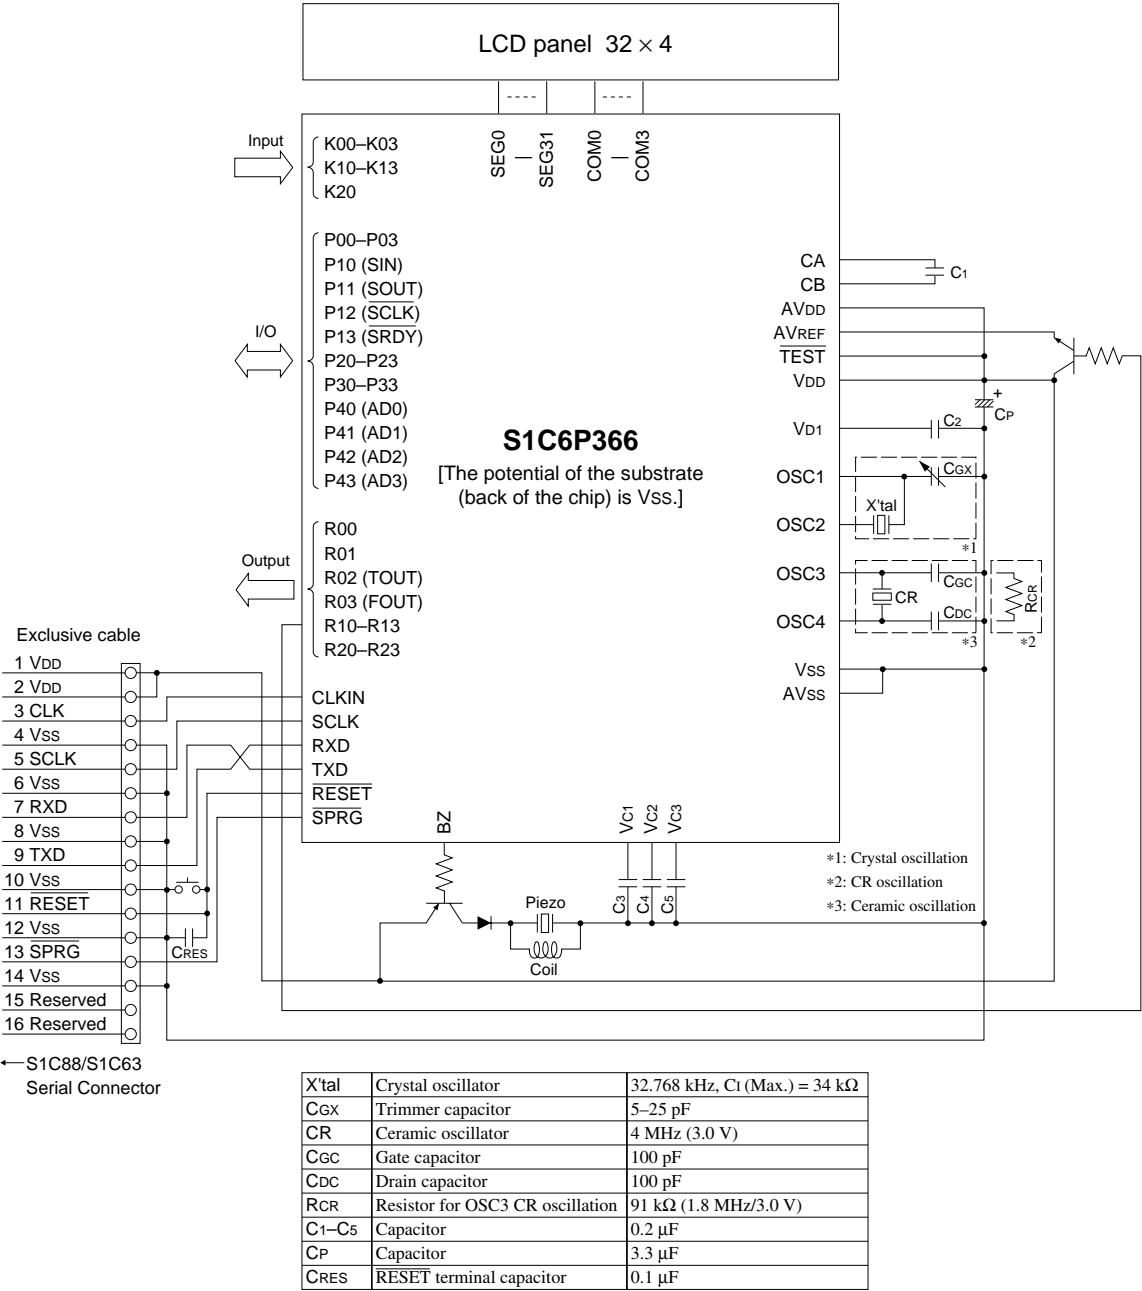

Table A.2.4.2 Connectors for connecting Universal Writer

Name	Model name
Box header (male) [target side]	3408-6002LCFL (3M) or equivalent
Socket connector (female) [SIO cable side]	Socket connector    7916-B500FL (3M) Strain relief        3448-7916 (3M) or equivalent

Notes: • Do not turn on the power of the target board since the PROM programming power (5 V) is supplied from the Universal Writer.

- Since PROM programming uses a 5-V power source, exercise care to the voltage ratings of the parts on the target board.

Sample connection diagram for serial programming (S1C88/S1C63 Serial Connector)

## A.3 Parallel Programming

### A.3.1 Parallel programming environment

Prepare a personal computer system as a host computer and the data for writing into the built-in Flash microcomputer.

#### (1) Personal computer

- IBM-PC/AT or compatible with a serial port (RS-232C)

#### (2) OS

- Windows95/98 English or Japanese version

#### (3) PROM writing tools

- S5U1C88000W1 package
- S5U1C6P366X1 package
- S5U1C6P366Y1 package

#### (4) User data (ROM data HEX file)

##### Executing HEX63xxx

Execute the HEX63xxx HEX Converter to create the ROM data HEX files (C3xxxxyy.HSA, C3xxxxyy.LSA) from the object file (C3xxxxyy.ABS).

Refer to the "S5U1C63000A Manual" for details of the HEX Converter.

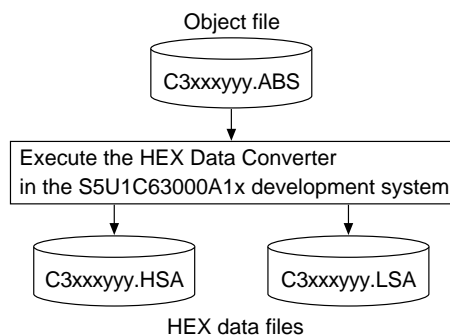

Fig. A.3.1.1 HEX63xxx execution flow

##### Executing segment option data converter

Execute the SDCP366 to create the segment option PROM HEX data file (C3xxxxyy.OSA) from a segment option document file (C3xxxxyy.SDC).

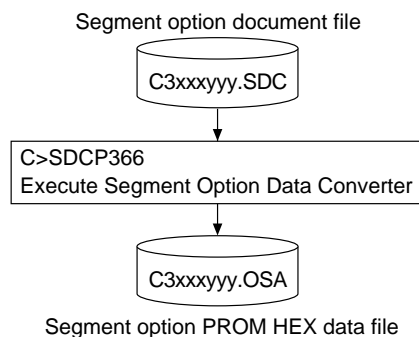

Fig. A.3.1.2 Segment option data converter execution flow

Copy the "SDCP366.EXE" to the current directory.

```
C>SDCP366
```

When the above command is executed, the message shown below appears on the screen for entering a segment option document file name.

```
*** Please input SOG document file name ***  
Input File Name == c3xxxyyy.sdc
```

Next, enter an output file name.

```
*** Please output SOG HEX file name ***  
Output File Name == cpxxxyyy.osa
```

The following message is displayed after the segment option PROM HEX file (CPxxxyyy.OSA) is generated.

```
Making file is completed
```

Close the MS-DOS prompt window.

The S5U1C6P366Y1 package contains the following files:

- SDCP366.EXE (Segment Option Data Converter executable file)
- CP366SEG.SDC (Recommended segment option document file)
- CP366SEG.OSA (Recommended segment option PROM HEX data file)

Refer to Section 4.7.4 "Segment option", for recommended segment option.

### A.3.2 System connection and setup for parallel programming

Connect the Universal Writer to the personal computer and install the S1C6P366 Adapter Socket to the Universal Writer.

Fig. A.3.2.1 System connection diagram

The system should be connected according to the following procedure.

- (1) Confirmation of power off status  
Make sure the power for the personal computer and the Universal Writer is switched off.
- (2) Connecting the power cable  
A dedicated power cable is included in the ROM Writer package. Connect the power cable to the AC IN connector on the rear panel of the ROM Writer.
- (3) Connecting the RS-232C cable  
Connect the Universal Writer and personal computer using the supplied RS-232C cable. The RS-232C cable is for IBM-PC/AT use (9 pins - 9 pins).

*Note:* Secure the RS-232C cable with the connector screws to prevent malfunction.

- (4) Installing the S1C6P366 Adapter Socket  
Install the S1C6P366 Adapter Socket to the top connector of the Universal Writer. There is a projection on the S1C6P366 Adapter Socket connector to prevent improper insertion. Line up the S1C6P366 Adapter Socket to fit to the notch of the Universal Writer connector.

*Note:* When disconnecting the S1C6P366 Adapter Socket, make sure the power for the Universal Writer is off.

- (5) Confirmation of DIP switch status  
Check to see that the DIP switch (DSW) located at the back panel of the Universal Writer has been set as the Figure A.3.2.2 (factory setting).

*Note:* Set SW1 and SW2 up, and SW3 to SW8 down.

Fig. A.3.2.2 DIP switch settings

### A.3.3 Parallel programming procedure

(1) Connecting the system

Connect the system as shown in Section A.3.2, "System connection and setup for parallel programming".

(2) Power on

Turn the personal computer on then the Universal Writer (POWER SW is located at the side panel).

(3) Checking the serial port configuration

Check to see that the serial port is assigned to COM1 in the personal computer.

(4) Preparing the Control Software and user data

Copy the following files included in the S5U1C6P366Y1 package to a folder on a hard disk drive. (The following examples assume that the files have been copied to the "C:\URW2" folder.)

S5U1C6P366Y1 package
RW63P366.EXE (English/Japanese version)
63P366.FRM

Then copy the user data (ROM data HEX file) to the same folder as above.

*Note: Be aware that the Control Software may not run normally if it is located in a folder that has a name with a space included (e.g. My Documents).*

(5) Starting up the Control Software

There are two methods to start up the control software.

- Execute the following command on the MS-DOS prompt window.

```
C:\URW2>RW63P366
```

- Double-click the RW63P366.EXE icon.

When the control software starts up, the following message is displayed.

```
UNIVERSAL ROM WRITER      Ver. 3.xx
(C)COPYRIGHT 200x SEIKO EPSON CORPORATION

LOADING 63P366 FIRMWARE PROGRAM Ver. 3.xx
.....
```

After displaying the message, a prompt as below is displayed.

```
63P366:
```

(6) Loading user data

Enter as below to load the code PROM HEX files (CP366xxx.HSA, CP366xxx.LSA).

```
63P366:LI CP366xxx
```

Enter as below to load the segment option PROM HEX file (CP366xxx.OSA).

```
63P366:LO CP366xxx
```

The S5U1C6P366Y1 package contains the recommended segment option PROM HEX data (CP366SEG.OSA).

## (7) Mounting the S1C6P366

Mount the IC as the figure below.

**Note:** Be aware that the IC may be damaged if parallel programming is performed by installing the IC to the S1C6P366 Adapter Socket in the wrong direction.

## (8) Erasing PROM

Clear (erase) the contents of the PROM (code PROM and segment option PROM) and perform erase check using the following command.

```
63P366:ERSA /E
```

"ERASE COMPLETED" is displayed when erasing has finished normally.

In a sample chip in which the PROM has not been protected, the code PROM and segment option PROM can be erased individually using the ERSI and ERSC commands, respectively. Refer to Section A.4.2, "Detailed description of the Universal ROM Writer II commands", for details.

**Notes:** • Inspection data is written to the PROM at shipment, so erase it once to initialize the contents.

- The PROM is protected when user data is written at Seiko Epson's factory. The protection is released after the contents have been erased by the ERSA command.

## (9) Writing user data

Write code PROM data and verify the written data using the following command.

```
63P366:WI /V
```

"WRITE COMPLETED" is displayed when writing has finished normally.

Then, write segment option PROM data and verify the written data using the following command.

```
63P366:WC /V
```

"WRITE COMPLETED" is displayed when writing has finished normally.

## (10) Removing the S1C6P366

Remove the S1C6P366 after checking that writing has finished normally. To continue writing, repeat from step (7) to step (10).

**Note:** Do not remove the S1C6P366 when the READY LED on the S1C6P366 Adapter Socket is not lit to prevent destruction.

**(11) Terminating the Control Software**

Execute the QUIT command to terminate the control software.

63P366:Q 

*Note: Restarting the control software after it has been terminated without the QUIT command, for instance the MS-DOS prompt window is closed, may cause an error such as "RAM CLEAR ERROR". In this case, turn the Universal Writer off once and then turn on before starting up the control software.*

**(12) Power off**

Turn the Universal Writer off (POWER SW is located at the side panel) then the personal computer.

## A.4 Universal ROM Writer II (S5U1C88000W1) Specifications

### A.4.1 Outline of Universal ROM Writer II specifications

This is a PROM writer for built-in Flash microcomputers. In the onboard serial programming mode, the SIO Cable supplied with the Universal Writer or the S1C88/S1C63 Serial Connector is used to connect the Universal Writer and the user target board that has a built-in Flash microcomputer installed. In the parallel programming mode, the Universal Writer can write data to the built-in Flash microcomputer through the Adapter Socket for each model installed on it.

It is connected to the host computer (personal computer) via an RS-232C. Its writing and other operations are controlled by the personal computer.

### Specifications of Control Section

The following describes the switches and connectors on the Universal Writer.

Figure A.4.1.1 shows an external view of the Universal Writer control section.

Fig. A.4.1.1 External view of Universal Writer control section

Table A.4.1.1 lists the functions of the control section.

Table A.4.1.1 Functions of control section

No.	Position	Marking	Name	Function
1	Top	POWER	Power on LED	This LED lights in red with the Universal Writer power on.
2	Top		Connectors for Adapter Socket or S1C88/S1C63 Serial Connector	These connectors are used to install the Adapter Socket or S1C88/S1C63 Serial Connector. The Adapter Socket is required for parallel programming and the S1C88/S1C63 Serial Connector is required for serial programming. Turn the power off before installing or removing the Adapter Socket or S1C88/S1C63 Serial Connector.
3	Side	POWER	Power switch	This is the power on/off switch of the Universal Writer. Power on with I; power off with O.
4	Side	FUSE	Fuse holder	A 1 A cartridge fuse is included.
5	Rear	AC IN	Power input connector	This is the connector for the power cable.
6	Rear	RS232C	RS-232C connector	This is the connector for the RS-232C cable. Secure the cable connector with the screws on the cable connector.
7	Rear	P2	SIO connector	This is the connector for the SIO cable. The SIO cable is necessary for serial programming.
8	Rear	Vss, TXD, RXD, CLK, SCLK, Vpp	Check pins	These pins are connected to the Vss, TXD, RXD, CLK, SCLK and the Vpp signals in the SIO interface.
9	Rear	DSW	DIP switch	This switch is used to set the transmission rate. It has been set to 9600 bps at the factory.

### A.4.2 Detailed description of the Universal ROM Writer II commands

This section explains the commands which can be used in RW63P366.

The following symbols have been used in the explanation:

\_ indicates space

A parameter enclosed by [ ] can be omitted

, indicates selection item

␣ indicates Enter key

---

#### 1 WRITE command (code PROM) for parallel programming

---

**Operation:**    **WI [ \_ /V ]␣**

**Option:**        /V ..... Verifies data from the code PROM start address after writing.

**Description:** The buffer RAM data in the PROM writer is written to the code PROM area in the S1C6P366 on the socket. The accessed code PROM address is displayed during writing.  
Option specification should be done every time the command is executed.

**Example:**        WI␣ ..... Writes data to the code PROM. Data is not verified.

---

#### 2 WRITE command (segment option PROM) for parallel programming

---

**Operation:**    **WC [ \_ /V ]␣**

**Option:**        /V ..... Verifies data from the segment option PROM start address after writing.

**Description:** The buffer RAM data in the PROM writer is written to the segment option PROM area in the S1C6P366 on the socket. The accessed segment option PROM address is displayed during writing.  
Option specification should be done every time the command is executed.

**Example:**        WC␣ ..... Writes data to the segment option PROM. Data is not verified.

---

#### 3 READ command (code PROM) for parallel programming

---

**Operation:**    **RI [ \_ /V ]␣**

**Option:**        /V ..... Verifies data from the code PROM start address after reading.

**Description:** The contents of the code PROM in the S1C6P366 on the socket are read to the buffer RAM in the PROM writer. The accessed code PROM address is displayed during reading.  
Option specification should be done every time the command is executed.

**Example:**        RI␣ ..... Reads the contents of the code PROM to the buffer RAM in the PROM writer.  
Data is not verified.

---

#### 4 READ command (segment option PROM) for parallel programming

---

**Operation:**    **RC [ \_ /V ]␣**

**Option:**        /V ..... Verifies data from the segment option PROM start address after reading.

**Description:** The contents of the segment option PROM in the S1C6P366 on the socket are read to the buffer RAM in the PROM writer. The accessed segment option PROM address is displayed during reading.  
Option specification should be done every time the command is executed.

**Example:**        RC␣ ..... Reads the contents of the segment option PROM to the buffer RAM in the PROM writer. Data is not verified.

## 5 *VERIFY command (code PROM) for parallel programming*

---

**Operation:** VI□

**Description:** Verifies the contents of the code PROM in the S1C6P366 on the socket and the contents of the buffer RAM in the PROM writer. The accessed code PROM address is displayed during verification. When an error occurs, verification stops. At this time, the address and data of the code PROM and the buffer RAM data are displayed. To resume verification, press **Enter**.

## 6 *VERIFY command (segment option PROM) for parallel programming*

---

**Operation:** VC□

**Description:** Verifies the contents of the segment option PROM in the S1C6P366 on the socket and the contents of the buffer RAM in the PROM writer. The accessed segment option PROM address is displayed during verification. When an error occurs, verification stops. At this time, the address and data of the segment option PROM and the buffer RAM data are displayed. To resume verification, press **Enter**.

## 7 *ERASE command (code PROM) for parallel programming*

---

**Operation:** ERSI [ \_ / E ]□

**Option:** /E ..... Performs erase check from the code PROM start address after erasing.

**Description:** Erases the code PROM in the S1C6P366 on the socket.  
Option specification should be done every time the command is executed.

## 8 *ERASE command (segment option PROM) for parallel programming*

---

**Operation:** ERSC [ \_ / E ]□

**Option:** /E ..... Performs erase check from the segment option PROM start address after erasing.

**Description:** Erases the segment option PROM in the S1C6P366 on the socket.  
Option specification should be done every time the command is executed.

## 9 *ERASE ALL command for parallel programming*

---

**Operation:** ERSA [ \_ / E ]□

**Option:** /E ..... Perform erase check after erasing.

**Description:** Erases the code PROM and segment option PROM in the S1C6P366 on the socket and then removes write protect.

## 10 *ERASE CHECK command (code PROM) for parallel programming*

---

**Operation:** EI□

**Description:** Checks that the code PROM in the S1C6P366 on the socket has been erased. The code PROM address is displayed during checking. When an error occurs, erase check stops. At this time, the address and data of the code PROM are displayed. To resume erase check, press **Enter**.

## 11 *ERASE CHECK command (segment option PROM) for parallel programming*

---

**Operation:** EC□

**Description:** Checks that the segment option PROM in the S1C6P366 on the socket has been erased. The segment option PROM address is displayed during checking. When an error occurs, erase check stops. At this time, the address and data of the segment option PROM are displayed. To resume erase check, press **Enter**.

## 12 PROTECT command for parallel programming

---

**Operation:** PROTECT □

**Description:** Sets the protect bit of the PROM in the S1C6P366 on the socket.  
When the protect bit has been set, execution of all the commands except for ERSA are disabled.

## 13 WRITE command (code PROM) for serial programming

---

**Operation:** FWI [ \_ /V ] □

**Option:** /V ..... Verifies data from the code PROM start address after writing.

**Description:** The buffer RAM data in the PROM writer is written to the S1C6P366 code PROM on the target board connected to the PROM writer. The accessed code PROM address is displayed during writing.  
Option specification should be done every time the command is executed.

**Example:** FWI □ ..... Writes data to the code PROM. Data is not verified.

## 14 WRITE command (segment option PROM) for serial programming

---

**Operation:** FWC [ \_ /V ] □

**Option:** /V ..... Verifies data from the segment option PROM start address after writing.

**Description:** The buffer RAM data in the PROM writer is written to the S1C6P366 segment option PROM on the target board connected to the PROM writer. The accessed segment option PROM address is displayed during writing.  
Option specification should be done every time the command is executed.

**Example:** FWC □ ..... Writes data to the segment option PROM. Data is not verified.

## 15 READ command (code PROM) for serial programming

---

**Operation:** FRI [ \_ /V ] □

**Option:** /V ..... Verifies data from the code PROM start address after reading.

**Description:** The contents of the S1C6P366 code PROM on the target board connected to the PROM writer are read to the buffer RAM in the PROM writer. The accessed code PROM address is displayed during reading.  
Option specification should be done every time the command is executed.

**Example:** FRI □ ..... Reads the contents of the code PROM to the buffer RAM in the PROM writer.  
Data is not verified.

## 16 READ command (segment option PROM) for serial programming

---

**Operation:** FRC [ \_ /V ] □

**Option:** /V ..... Verifies data from the segment option PROM start address after reading.

**Description:** The contents of the S1C6P366 segment option PROM on the target board connected to the PROM writer are read to the buffer RAM in the PROM writer. The accessed segment option PROM address is displayed during reading.  
Option specification should be done every time the command is executed.

**Example:** FRC □ ..... Reads the contents of the segment option PROM to the buffer RAM in the PROM writer. Data is not verified.

**17 VERIFY command (code PROM) for serial programming**

---

**Operation:** FVI□

**Description:** Verifies the contents of the S1C6P366 code PROM on the target board connected to the PROM writer and the contents of the buffer RAM in the PROM writer. The accessed code PROM address is displayed during verification. When an error occurs, verification stops. At this time, the address and data of the code PROM and the buffer RAM data are displayed. To resume verification, press Enter.

**18 VERIFY command (segment option PROM) for serial programming**

---

**Operation:** FVC□

**Description:** Verifies the contents of the S1C6P366 segment option PROM on the target board connected to the PROM writer and the contents of the buffer RAM in the PROM writer. The accessed segment option PROM address is displayed during verification. When an error occurs, verification stops. At this time, the address and data of the segment option PROM and the buffer RAM data are displayed. To resume verification, press Enter.

**19 ERASE command (code PROM) for serial programming**

---

**Operation:** FERSI [ \_ / E ]□

**Option:** /E ..... Performs erase check from the code PROM start address after erasing.

**Description:** Erases the S1C6P366 code PROM on the target board connected to the PROM writer. Option specification should be done every time the command is executed.

**20 ERASE command (segment option PROM) for serial programming**

---

**Operation:** FERSC [ \_ / E ]□

**Option:** /E ..... Performs erase check from the segment option PROM start address after erasing.

**Description:** Erases the S1C6P366 segment option PROM on the target board connected to the PROM writer. Option specification should be done every time the command is executed.

**21 ERASE ALL command for serial programming**

---

**Operation:** FERSA [ \_ / E ]□

**Option:** /E ..... Perform erase check after erasing.

**Description:** Erases the code PROM and segment option PROM in the S1C6P366 on the target board connected to the PROM writer and then removes write protect.

**22 ERASE CHECK command (code PROM) for serial programming**

---

**Operation:** FEI□

**Description:** Checks that the S1C6P366 code PROM on the target board connected to the PROM writer has been erased. The code PROM address is displayed during checking. When an error occurs, erase check stops. At this time, the address and data of the code PROM are displayed. To resume erase check, press Enter.

## 23 ERASE CHECK command (segment option PROM) for serial programming

---

**Operation:** **FEC** 

**Description:** Checks that the S1C6P366 segment option PROM on the target board connected to the PROM writer has been erased. The segment option PROM address is displayed during checking. When an error occurs, erase check stops. At this time, the address and data of the segment option PROM are displayed. To resume erase check, press .

## 24 PROTECT command for serial programming

---

**Operation:** **FPROTECT** 

**Description:** Sets the protect bit of the S1C6P366 PROM on the target board connected to the PROM writer.  
When the protect bit has been set, execution of all the commands except for FERSA are disabled.

## 25 LOAD command (for code PROM file)

---

**Operation:** **LI \_ file name** 

**Option:** file name ..... File name to be loaded (without extension)

**Description:** The specified code PROM file is loaded in the host computer and transferred to the PROM writer. This command loads two code PROM files converted by the HEX63xxx (high-order HEX data file and low-order HEX data file) for the code PROM. The file name should be specified without the extension.

**Example:** LI\_C3358001  ..... Loads the C3358001.HSA and C3358001.LSA files.

## 26 LOAD command (for segment option PROM file)

---

**Operation:** **LO \_ file name** 

**Option:** file name ..... File name to be loaded (without extension)

**Description:** The specified segment option PROM file is loaded in the host computer and transferred to the PROM writer. This command loads a segment option PROM file changed by the SDCP366. The file name should be specified without the extension.

**Example:** LO\_CP366001  ..... Loads the CP366001.OSA file.

## 27 SAVE command (for code PROM file)

---

**Operation:** **SI \_ file name** 

**Option:** file name ..... File name to be saved (without extension)

**Description:** Saves the code PROM data in the buffer RAM of the PROM writer into two files, a high-order data file with the specified name and .HSA extension and a low-order data file with the specified name and .LSA extension. The file name should be specified without the extension.

**Example:** SI\_C3358001  ..... Saves the code PROM data into the C3358001.HSA and C3358001.LSA files.

## 28 SAVE command (for segment option PROM file)

---

**Operation:** SO \_ file name□

**Option:** file name ..... File name to be saved (without extension)

**Description:** Saves the segment option PROM data in the buffer RAM of the PROM writer into a file with the specified name and .OSA extension. The file name should be specified without the extension.

**Example:** SO\_CP366001□ ..... Saves the segment option PROM data into the CP366001.OSA file.

## 29 DUMP command (for code PROM)

---

**Operation:** DI [ \_ address 1 [ \_ address 2 ] ] [ \_/L, /H]□

**Option:** address 1 ..... Dump start address

Can be specified within the range of 0000H to 3FE0H in 20H units.

address 2 ..... Dump end address

Can be specified within the range of 001FH to 3FFFH in 20H units.

/L ..... Displays low-order 8 bit data only (corresponding to C3xxxyyy.LSA)

/H ..... Displays high-order 5 bit data only (corresponding to C3xxxyyy.HSA)

**Description:** Displays the code PROM data in the buffer RAM with the specified format. When address 1 and address 2 have been specified, data from address 1 to address 2 is displayed. When address 1 only has been specified, data for the screen size from address 1 is displayed. When both address 1 and address 2 have been omitted, data for the screen size is displayed from the address that follows the previously displayed end address (default address is 0000H).

When the /L and /H options have been omitted, PROM image data is displayed in 13-bit units. When /L has been specified, the low-order 8 bit data is displayed in the C3xxxyyy.LSA HEX file image. When /H has been specified, the high-order 5 bit data is displayed in the C3xxxyyy.HSA HEX file image. When /L or /H has been specified, the addresses are displayed according to the file.

Option specification should be done every time the command is executed.

**Examples:** DI\_0\_1F□ .. Displays the RAM data corresponding to the code PROM addresses 0 to 1F.

```
00000  1FF0 1EF1 1DF2 1CF3 1BF4 1AF5 19F6 18F7
00008  17F8 16F9 15FA 14FB 13FC 12FD 11FE 10FF
      :
00018  1F78 1F69 1F5A 1F4B 1F3C 1F2D 1F1E 1F0F
```

DI\_0\_/L□ .. Displays data corresponding to the C3xxxyyy.LSA HEX file from address 0.

```
00000  F0 F1 F2 F3 F4 F5 F6 F7 F8 F9 FA FB FC FD FE FF
00010  FF FF FF FF FF FF FF FF FF FF FF FF FF FF FF
      :
000F0  FF FF FF FF FF FF FF FF FF FF FF FF FF FF FF
```

### 30 DUMP command (for segment option PROM)

- 
- Operation:** **DC [ \_ address 1 [ \_ address 2 ] ] [ /C ]**
- Option:** address 1 ..... Dump start address  
Can be specified within the range of 0000H to 03E0H in 20H units.  
address 2 ..... Dump end address  
Can be specified within the range of 001FH to 03FFH in 20H units.  
/C ..... Displays in HEX file (C3xxxyy.SSA) format
- Description:** Displays the segment option PROM data in the buffer RAM with the specified format. When address 1 and address 2 have been specified, data from address 1 to address 2 is displayed. When address 1 only has been specified, data for the screen size from address 1 is displayed. When both address 1 and address 2 have been omitted, data for the screen size is displayed from the address that follows the previously displayed end address (default address is 00000H).  
When /C has been omitted, PROM image data is displayed in 4-bit units. When /C has been specified, data is displayed in the C3xxxyy.SSA HEX file image.
- Examples:** DC\_100\_1FF ..... Displays data from address 100 to address 1FF in PROM image.  
00100 0 1 2 3 4 5 6 7 8 9 A B C D E F  
00110 0 1 2 3 4 5 6 7 8 9 A B C D E F  
:  
001F0 0 1 2 3 4 5 6 7 8 9 A B C D E F  
  
DC\_0000\_/C ..... Displays data from address 0 in HEX file image.  
00000 00 01 02 03 04 05 06 07 08 09 0A 0B 0C 0D 0E 0F  
00010 00 01 02 03 04 05 06 07 08 09 0A 0B 0C 0D 0E 0F  
:  
000F0 00 01 02 03 04 05 06 07 08 09 0A 0B 0C 0D 0E 0F

### 31 LOGGING command

- 
- Operation:** **LOG \_ file name**  
**LOG \_/E**
- Option:** file name ..... File name to be logged for screen data, file extension included  
/E ..... Terminates data logging.
- Description:** Data that has been displayed on the screen are saved to a file with the specified file name. The command is terminated by entering LOG\_/E.
- Examples:** LOG\_c3358001.dat ..... After this, data that will be displayed on the screen will be saved in the C3358001.DAT file.  
LOG\_/E ..... Logging is terminated, and data after this will not be saved.

### 32 MACRO execution command

- 
- Operation:** **MAC \_ file name**
- Option:** file name ..... Macro file name including file extension
- Description:** Reads the specified macro file in which commands have been recorded and executes the commands.
- Example:** MAC\_c3358.mac ..... The macro file C3358.MAC is loaded and the commands included in the file are executed.  
LI\_c3358001 When the file contains the commands indicated at the left,  
WI the code PROM data is loaded and written to the code PROM.

### 33 COMMAND HISTORY

---

Operation:   

Description: Previously input commands are displayed. A command displayed can be re-executed by selecting with  or  and pressing . Up to 20 commands can be stored in the buffer.

### 34 TEMPLATE

---

Operation:   

Description: Previously input command can be re-displayed. Pressing  displays the characters of the command one by one, and pressing  displays all the characters at once.

Example: When LI\_C3358001 has been input previously.

	
L	
	
LI	..... Pressing  displays the characters one by one.
	
LI_	
	
LI_C3358001	..... Pressing  displays all the characters at once.

### 35 DOS command

---

Operation: **DOS**

Description: Returns to DOS temporally. To return from DOS, enter EXIT.

Example: 63P366:DOS  
 C> ..... Returns to DOS.  
 C>EXIT  
 63P366: ..... Entering EXIT returns to the program.

### 36 HELP command

---

Operation: **HELP**

Description: Command list is displayed.

### 37 QUIT command

---

Operation: **Q**

Description: Terminates the program and returns to DOS.

### A.4.3 List of commands

No.	Item	Operation	Function
1	Parallel writing	WI [_/V]	Writes the RAM data to the code PROM on the socket.
2		WC [_/V]	Writes the RAM data to the segment option PROM on the socket.
3	Parallel reading	RI [_/V]	Reads data from the code PROM on the socket to the RAM.
4		RC [_/V]	Reads data from the segment option PROM on the socket to the RAM.
5	Parallel verification	VI	Compares data between the code PROM on the socket and the RAM.
6		VC	Compares data between the segment option PROM on the socket and the RAM.
7	Parallel erasing	ERSI [_/E]	Erases the code PROM on the socket.
8		ERSC [_/E]	Erases the segment option PROM on the socket.
9		ERSA [_/E]	Erases the code PROM and segment option PROM on the socket and removes write protect.
10	Parallel erase check	EI	Performs erase check for the code PROM on the socket.
11		EC	Performs erase check for the segment option PROM on the socket.
12	Parallel protection	PROTECT	Protects the PROM on the socket.
13			
14	Serial writing	FWI [_/V]	Writes the RAM data to the code PROM on the target board.
15		FWC [_/V]	Writes the RAM data to the segment option PROM on the target board.
16	Serial reading	FRI [_/V]	Reads data from the code PROM on the target board to the RAM.
17		FRC [_/V]	Reads data from the segment option PROM on the target board to the RAM.
18	Serial verification	FVI	Compares data between the code PROM on the target board and the RAM.
19		FVC	Compares data between the segment option PROM on the target board and the RAM.
20	Serial erasing	FERSI [_/E]	Erases the code PROM on the target board.
		FERSC [_/E]	Erases the segment option PROM on the target board.
21		FERSA [_/E]	Erases the code PROM and segment option PROM on the target board and removes write protect.
22	Serial erase check	FEI	Performs erase check for the code PROM on the target board.
23		FEC	Performs erase check for the segment option PROM on the target board.
24	Serial protection	FPROTECT	Protects the PROM on the target board.
25	Loading from file	LI_file name	Loads code PROM files from the host computer to the PROM writer.
26		LO_file name	Loads a segment option PROM file from the host computer to the PROM writer.
27	Saving to file	SI_file name	Saves the code PROM data in the PROM writer as two files in the host computer.
28		SO_file name	Saves the segment option PROM data in the PROM writer as a file in the host computer.
29	Dump	DI [_address1 [_address2]] [_/H/L]	Dumps (displays) the code PROM data in the RAM.
30		DC [_address1 [_address2]] [_/C]	Dumps (displays) the segment option PROM data in the RAM.
31	Logging	LOG_file name LOG_/E	Saves data displayed on the screen. Terminates by /E.
32	Macro	MAC_file name	Executes the commands recorded in the macro file.
33	History		Displays the commands that have been input.
34	Template	or	Displays the previously input command.
35	DOS	DOS EXIT	Returns to DOS temporarily. Returns from DOS by entering EXIT.
36	HELP	HELP	Displays list of commands.
37	QUIT	Q	Terminates the program and returns to DOS.

- \_ indicates space key.
- A parameter enclosed by [ ] can be omitted.
- , indicates selection item.

- indicates key.
- Loading and saving file names must not include extension.
- Logging and macro file names must include extension.

**A.4.4 Universal ROM Writer II error messages**

Error message	Description
PROM WRITER NOT POWER ON	The PROM writer does not respond when a start-up check command is issued.
SUM CHECK ERROR	An IPL checksum error has occurred in the PROM writer.
RAM R/W ERROR	An error has occurred during R/W check for the RAM.
FILE DATA FORMAT ERROR	There is an error in the data format of the file to be transferred.
FILE DATA SUMCHECK ERROR	There is an error in the checksum data of the file.
COMMUNICATION ERROR 1	The PROM writer does not respond when a command is issued from the host computer. The PROM writer sent NAK to the host computer. The host computer sent NAK to the PROM writer.
COMMUNICATION ERROR 2	The S1C6P366 on the target board does not respond or sent NAK to the PROM writer.
COMMUNICATION ERROR 3	The S1C6P366 on the target board returns an incorrect command when a command is issued from the PROM writer.
WRITE ERROR ADDRESS PROM : RAM XXX XXX XXX	An error has occurred during writing data to the PROM (on the socket or target board). An error has occurred during checking after writing.
WRITE ERROR ADDRESS PROM : RAM XXX X X	
VERIFY ERROR ADDRESS PROM : RAM XXX XXX XXX	A verification error has occurred.
VERIFY ERROR ADDRESS PROM : RAM XXX X X	
ERASE ERROR ADDRESS PROM XXX XXX	Data bit other than "1" has been detected during erase check.
ERASE ERROR ADDRESS PROM XXX X	
COMMAND ERROR	Input format is incorrect. Option is incorrect.
FILE NOT FOUND	The specified file is not found.

## ***A.5 Flash EEPROM Programming Notes***

---

- (1) The programing voltage of the S1C6P366 PROM must be 5 V.
- (2) Since PROM programming uses a 5-V power source, be careful of the voltage ratings of the parts on the target board.
- (3) Make sure that the READY LED on the S1C88/S1C63 Serial Connector or S1C6P366 Adapter Socket is lit when connecting (mounting) or disconnecting (removing) the target board (S1C6P366).
- (4) When performing serial programming using the Universal Writer, turn the power of the target board off since the PROM programing power (5 V) is supplied from the Universal Writer.
- (5) Make sure the personal computer is off before connecting or disconnecting the PROM Writer.
- (6) After connecting the PROM Writer to the serial port of the personal computer, secure the RS-232C cable with the connector screws.
- (7) The QUIT command should be executed to terminate the Universal Writer Control Software.

# APPENDIX B S5U1C63000P MANUAL

## (PERIPHERAL CIRCUIT BOARD FOR S1C63158/358/P366)

This manual describes how to use the Peripheral Circuit Board for the S1C63158/358/P366 (S5U1C63000P), which provides emulation functions when mounted on the debugging tool for the S1C63 Family of 4-bit single-chip microcomputers, the ICE (S5U1C63000H1/S5U1C63000H2).

This description of the S1C63 Family Peripheral Circuit Board (S5U1C63000P) provided in this document assumes that circuit data for the S1C63158/358/P366 has already been downloaded to the board. For information on downloading various circuit data and on common board specifications, please see the S5U1C63000P Manual (S1C63 Family Peripheral Circuit Board) included with the product. Please refer to the user's manual provided with your ICE for detailed information on its functions and method of use.

### B.1 Names and Functions of Each Part

The following explains the names and functions of each part of the board (S5U1C63000P).

#### (1) VLCD

You can turn this control to adjust the LCD drive power supply voltage. However, in the actual IC, LCD drive power supply voltage cannot be adjusted.

#### (2) VSVD

This control allows you to vary the power supply voltage artificially in order to verify the operation of the power supply voltage detect function (SVD). Keep in mind that a single control position indicates two voltage values.

SVD levels	0	1	2	3	4	5	6	7
	8	9	10	11	12	13	14	15

(For example, SVD levels 0 and 8 are at the same control position.)

#### (3) Register monitor LEDs

These LEDs correspond one-to-one to the registers listed below. The LED lights when the data is logic "1" and goes out when the data is logic "0".

VDC, OSCC, CLKCHG, DBON, HLON, VDSEL, VADSEL, SVDS0-3, SVDON, LPWR, VCCHG

**(4) Register monitor pins**

These pins correspond one-to-one to the registers listed below. The pin outputs a high for logic "1" and a low for logic "0".

Monitor		LED	
Pin No.	Name	LED No.	Name
1	DONE *1	1	DONE *1
2	VDC	2	VDC
3	OSCC	3	OSCC
4	CLKCHG	4	CLKCHG
5	DBON *2	5	DBON *2
6	—	6	—
7	VDSEL	7	VDSEL
8	VADSEL	8	VADSEL
9	SVDS0	9	SVDS0
10	SVDS1	10	SVDS1
11	SVDS2	11	SVDS2
12	SVDS3	12	SVDS3
13	SVDON	13	SVDON
14	LPWR	14	LPWR
15	VCCHG	15	VCCHG
16	—	16	—

\*1 DONE: The monitor pin outputs a high while the LED lights when initialization of this board completes without problems.

\*2 DBON: Used for the S1C63158 and S1C6P366.

**(5) CR oscillation frequency adjusting control**

When OSC1 and OSC3 respectively are set for a CR oscillation circuit and a CR/ceramic oscillation circuit by a mask option, this control allows you to adjust the oscillation frequency. The oscillation frequency can be adjusted in the range of approx. 20 kHz to 500 kHz for OSC1 and approx. 100 kHz to 8 MHz for OSC3. Note that the actual IC does not operate with all of these frequencies; consult the technical manual for the S1C63158/358/P366 to select the appropriate operating frequency.

**(6) CR oscillation frequency monitor pins**

These pins allow you to monitor the clock waveform from the CR oscillation circuit with an oscilloscope. Note that these pins always output a signal waveform whether or not the oscillation circuit is operating.

**(7) RESET switch**

This switch initializes the internal circuits of this board and feeds a reset signal to the ICE.

**(8) Monitor pins and external part connecting socket**

These parts are currently unused.

**(9) CLK and PRG switch**

If power to the ICE is shut down before circuit data downloading is complete, the circuit configuration in this board will remain incomplete, and the debugger may not be able to start when you power on the ICE once again. In this case, temporarily power off the ICE and set CLK to the 32K position and the PRG switch to the Prog position, then switch on power for the ICE once again. This should allow the debugger to start up, allowing you to download circuit data. After downloading the circuit data, temporarily power off the ICE and reset CLK and PRG to the LCLK and the Norm position, respectively. Then power on the ICE once again.

**(10) IOSEL2**

When downloading circuit data, set IOSEL2 to the "E" position. Otherwise, set to the "D" position.

**(11) VC5**

Unused.

## B.2 Connecting to the Target System

To connect this board (S5U1C63000P) to the target system, use the I/O connecting cables supplied with the board (80-pin/40-pin  $\times$  2, 100-pin/50-pin  $\times$  2, flat type). Take care when handling the connectors, since they conduct electrical power ( $V_{DD} = +3.3$  V).

Fig. B.2.1 Connecting the S5U1C63000P to the target system

Table B.2.1 I/O connector pin assignment

40-pin CN1-1 connector		40-pin CN1-2 connector		50-pin CN2-1 connector		50-pin CN2-2 connector	
No.	Pin name	No.	Pin name	No.	Pin name	No.	Pin name
1	V <sub>DD</sub> (=3.3 V)	1	V <sub>DD</sub> (=3.3 V)	1	V <sub>DD</sub> (=3.3 V)	1	V <sub>DD</sub> (=3.3 V)

39	V <sub>SS</sub>	39	V <sub>SS</sub>	39	SEG30 (DC)	39	Cannot be connected
40	V <sub>SS</sub>	40	V <sub>SS</sub>	40	SEG31 (DC)	40	Cannot be connected
				41	V <sub>DD</sub> (=3.3 V)	41	V <sub>DD</sub> (=3.3 V)
				42	V <sub>DD</sub> (=3.3 V)	42	V <sub>DD</sub> (=3.3 V)
				43	Cannot be connected	43	Cannot be connected
				44	Cannot be connected	44	Cannot be connected
				45	Cannot be connected	45	Cannot be connected
				46	Cannot be connected	46	Cannot be connected
				47	Cannot be connected	47	Cannot be connected
				48	Cannot be connected	48	Cannot be connected
				49	Cannot be connected	49	Cannot be connected
				50	Cannot be connected	50	Cannot be connected

\* Connectors CN2-1 and CN2-2 are used when the SEG pins are set for DC output with a mask option.

## B.3 Usage Precautions

---

To ensure correct use of this board (S5U1C63000P), please observe the following precautions.

### B.3.1 Operational precautions

- (1) Before inserting or removing cables, turn off power to all pieces of connected equipment.
- (2) Do not turn on power or load mask option data if all of the input ports (K00–K03) are held low. Doing so may activate the multiple key entry reset function.
- (3) Before debugging, always be sure to load mask option data.

### B.3.2 Differences with the actual IC

#### (1) Differences in I/O

##### *<Interface power supply>*

This board and target system interface voltage is set to +3.3 V. To obtain the same interface voltage as in the actual IC, attach a level shifter circuit, etc. on the target system side to accommodate the required interface voltage.

##### *<Each output port's drive capability>*

The drive capability of each output port on this board is higher than that of the actual IC. When designing application system and software, refer to the technical manual for the S1C63158/358/P366 to confirm each output port's drive capability.

##### *<Each port's protective diode>*

All I/O ports incorporate a protective diode for VDD and VSS, and the interface signals between this board and the target system are set to +3.3 V. Therefore, this board and the target system cannot be interfaced with voltages exceeding VDD by setting the output ports for open-drain mode.

##### *<Pull-up resistance value>*

The pull-up resistance values on this board are set to 220 kΩ which differ from those for the actual IC. For the resistance values on the actual IC, refer to the technical manual for the S1C63158/358/P366. Note that when using pull-up resistors to pull the input pins high, the input pins may require a certain period to reach a valid high level. Exercise caution if a key matrix circuit is configured using a combination of output and input ports, since rise delay times on these input ports differ from those of the actual IC.

#### (2) Differences in current consumption

The amount of current consumed by this board differs significantly from that of the actual IC. Inspecting the LEDs on this board may help you keep track of approximate current consumption. The following factors/components greatly affect device current consumption:

##### *<Those which can be verified by LEDs and monitor pins>*

- a) Run and Halt execution ratio (verified by LEDs and monitor pins on the ICE)
- b) CPU operating voltage select circuit (VDC)
- c) OSC3 oscillation on/off circuit (OSCC)
- d) CPU clock change circuit (CLKCHG)
- e) ×2 boost on/off circuit (DBON)
- f) Power supply select circuit for oscillator-system voltage-regulating circuit (VDSEL)
- g) Power supply select circuit for A/D converter circuit (VADSEL)
- h) SVD circuit on/off circuit (SVDON)
- i) LCD power supply on/off circuit (LPWR)
- j) LCD constant-voltage change circuit (VCCHG)

##### *<Those that can only be counteracted by system or software>*

- k) Current consumed by the internal pull-up resistors
- l) Input ports in a floating state

### (3) Functional precautions

#### <LCD power supply circuit>

There is a finite delay time from the point at which the LCD power supply circuit (LPWR) turns on until an LCD drive waveform is output. On this board, this delay is set to approx. 125 msec, which differs from that of the actual IC. Refer to the technical manual for the S1C63158/358/P366.

#### <Differences in LCD drive waveform>

If the LCD is set for static output (STCD register = "1"), the LCD drive waveform on this board and that of the actual IC will differ in the following respects (for 1/3 bias only).

#### <SVD circuit>

- Although the S1C63158/358/P366 has a function for detecting externally sourced voltages, this board is unable to detect externally sourced voltages. The SVD function is realized by artificially varying the power supply voltage using the VSVD control on this board.
- There is a finite delay time from when the power to the SVD circuit turns on until actual detection of the voltage. On this board, this delay is set to 61–92  $\mu$ sec, which differs from that of the actual IC. Refer to the technical manual for the S1C63158/358/P366 when setting the appropriate wait time for the actual IC.

#### <Oscillation circuit>

- A wait time is required before oscillation stabilizes after the OSC3 oscillation control circuit (OSCC) is turned on. On this board, even when OSC3 oscillation is changed (CLKCHG) without a wait time, OSC3 will function normally. Refer to the technical manual for the S1C63158/358/P366 when setting the appropriate wait time for the actual IC.
- Use separate instructions to switch the clock from OSC3 to OSC1 and to turn off the OSC3 oscillation circuit. If executed simultaneously with a single instruction, these operations, although good with this board, may not function properly well with the actual IC.
- Because the logic level of the oscillation circuit is high, the timing at which the oscillation starts on this board differs from that of the actual IC.
- This board contains oscillation circuits for OSC1 and OSC3. Keep in mind that even though the actual IC may not have a resonator connected to its OSC3, its emulator can operate with the OSC3 circuit.
- Do not turn on the OSC3 oscillation circuit when the voltage-regulating circuit for high-speed operation remains idle.

*<Access to undefined address space>*

If any undefined space in the S1C63158/358/P366's internal ROM/RAM or I/O is accessed for data read or write operations, the read/written value is indeterminate. Additionally, it is important to remain aware that indeterminate state differs between this board and the actual IC. Note that the ICE (S5U1C63000H1/S5U1C63000H2) incorporates the program break function caused by accessing to an undefined address space.

*<Reset circuit>*

Keep in mind that the operation sequence from when the ICE and this board are powered on until the time at which the program starts running differs from the sequence from when the actual IC is powered on till the program starts running. This is because this board becomes capable of operating as a debugging system after the user program and optional data are downloaded. When operating the ICE after placing it in free-running mode, always apply a system reset. A system reset can be performed by pressing the reset switch on this board, by a reset pin input, or by holding the input ports low simultaneously.

*<Internal power supply circuit>*

- Although this board contains VDC, DBON, HLON, VDSEL, and VADSEL registers, it does not actually exercise power supply control by these registers. Be sure to refer to the technical manual for the S1C63158/358/P366 when setting the correct voltage. Also, when switching the control voltages, consult the technical manual to determine the appropriate wait time to be inserted.
- Although this board has a control (VLCD) for adjusting the LCD drive voltage, the actual IC does not have this capability. Note that the LCD drive voltage on this board may not be identical to that on the actual IC.
- Since the usable operating frequency range depends on the device's internal operating voltage, consult the technical manual for the S1C63158/358/P366 to ensure that the device will not be operated with an inappropriate combination of the operating frequency and the internal power supply.

*<Differences in I/O registers>*

Although the register bit D1 (address FF01H) is always set to 0 when read out, it operates as a read/write register on this board. Take care to avoid writing a 1 to this bit.
