GTLP10B320
10-Bit LVTTL/GTLP Transceiver with Split LVTTL Port and Feedback Path

General Description

The GTLP10B320 is a 10-bit Universal bus driver and receiver, with separate LVTTL inputs and outputs and a feedback path for diagnostics, that provides LVTTL to GTLP signal level translation. High speed backplane operation is a direct result of GTLP's reduced output swing (<1V), reduced input threshold levels and output edge rate control. The edge rate control minimizes bus settling time. GTLP is a Fairchild Semiconductor derivative of the Gunning Transistor logic (GTL) JEDEC standard JESD8-3.

Fairchild's GTLP has internal edge-rate control and is process, voltage and temperature (PVT) compensated. Its function is similar to BTL and GTL but with different output levels and receiver threshold. GTLP output low level is typically less than 0.5V, the output level high is 1.5V and the receiver threshold is 1.0V.

Features

- Bidirectional interface between GTLP and LVTTL logic levels
- Variable edge rate control pin to select desired edge rate on GTLP port (V_{ERC})
- V_{REF} pin provides external supply reference voltage for receiver threshold adjustibility
- Split LVTTL inputs and outputs
- Special PVT compensation circuitry to provide consistent performance over variations of process, supply voltage and temperature
- A feedback path for control and diagnostics monitoring
- TTL compatible driver and control inputs
- Designed using Fairchild advanced BiCMOS technology
- Bushold data inputs on A port to eliminate the need for external pull-up resistors for unused inputs
- Power up/down and power off high impedance for live insertion
- Open drain on GTLP to support wired-or connection
- Flow through pinout optimizes PCB layout
- A Port source/sink –24mA/+24mA
- B Port sink +50mA

Ordering Code:

Order Number	Package Number	Package Description
GTLP10B320MTD	MTD56	56-Lead Thin Shrink Small Outline Package (TSSOP), JEDEC MO-153, 6.1mm Wide

Device is also available in Tape and Reel. Specify by appending the suffix letter "X" to the ordering code.

Pin Descriptions

Pin Names	Description
$\overline{OEB}$, $\overline{OEC}$	B Port, C Port Output Enable respectively (Active LOW)
V_{CC}, GND, V_{REF}	Device Supplies
LECLKAB, LECLKBC	A-to-B, B-to-C Latch $\overline{CLK}$ respectively (Transparent Active HIGH)
$\overline{SEL}$	Selects Internal Feedback Path
SAB, SBC	Selects Register or Latch/Transparent Path for A-to-B and B-to-C respectively
B_0-B_9	B Port GTLP I/O
A_0-A_9	A Port LVTTL Inputs
C_0-C_9	C Port LVTTL Outputs
V_{ERC}	Edge Rate Control Pin (GND = Slow Edge Rate) (V_{CC} = Fast Edge Rate)

Functional Description

The GTLP10B320 is a 10-bit Universal driver and receiver containing D-Type flip-flop, latch, and transparent modes of operation for the data paths. In addition there is an internal feedback path that can be used for diagnostic monitoring or caching schemes. Data flow in each direction is controlled by the clock signals (LECLKAB and LECLKBC) and output enables ($\overline{OEB}$ and $\overline{OEC}$). The internal feedback path is controlled by the $\overline{SEL}$ pin and allows data transfer from Port A to Port C without requiring data to be output to the backplane. The internal feedback path is selected with $\overline{SEL}$ LOW and the B Port pin is selected with $\overline{SEL}$ HIGH. The data paths can also be configured for latch/transparent or register mode for each direction with the SAB and SBC pins. Data polarity is non-inverting with the GTLP outputs enabled via the $\overline{OEB}$ pin and the LVTTL outputs being enabled via the $\overline{OEC}$ pin.

For A-to-B data flow the device is configured into a latch/transparent or register mode by pin SAB. If SAB is LOW then the register mode is selected and the device operates on the LOW-to-HIGH transition of LECLKAB. If SAB is HIGH then the latch/transparent configuration is selected and a HIGH-to-LOW transition of LECLKAB stores data in the latch. If LECLKAB is HIGH the device is in transparent mode. When $\overline{OEB}$ is LOW the outputs are active and when $\overline{OEB}$ is HIGH the outputs are high impedance.

Note 5: Absolute Maximum Ratings are those values beyond which the safety of the device cannot be guaranteed. The device should not be operated at these limits. The parametric values defined in the "Electrical Characteristics" table are not guaranteed at the absolute maximum rating. The "Recommended Operating Conditions" table will define the conditions for actual device operation.

Note 6: I_O Absolute Maximum Rating must be observed.

Note 7: All typical values are at V_{CC} = 3.3V and T_A = 25°C.

Note 8: For conditions shown as Min, use the appropriate value specified under recommended operating conditions.

Note 9: This is the increase in supply current for each input that is at the specified TTL voltage level rather than V_{CC} or GND.

Note: GTLP V_{REF} and V_{TT} are specified to 2% tolerance since signal integrity and noise margin can be significantly degraded if these supplies are noisy. In addition, V_{TT} and R_{TERM} can be adjusted beyond the recommended operating to accommodate backplane impedances other than 50Ω, but must remain within the boundaries of the DC Absolute Maximum Ratings. Similarly, V_{REF} can be adjusted to optimize noise margin.

t_{PZH}, t_{PZL}	$\overline{OEB}$	B_n	0.2	2.1	4.4	ns
t_{PHZ}, t_{PLZ}			1.3	3.0	5.5	

Note 13: All typical values are at V_{CC} = 3.3V, and T_A = 25°C.

AC Extended Electrical Characteristics

Over recommended ranges of supply voltage and operating free air temperature V_{REF} = 1.0V (unless otherwise noted).
C_L = 30 pF for B Port and C_L = 50 pF for C Port.

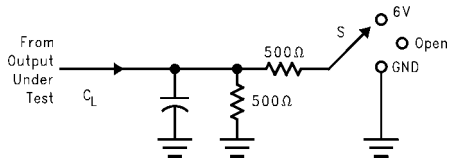
Note 14: t_{OSHL}/t_{OSLH} and t_{OST} - Output to output skew is defined as the absolute value of the difference between the actual propagation delay for all outputs within the same packaged device. The specifications are given for specific worst case V_{CC} and temperature and apply to any outputs switching in the same direction either HIGH-to-LOW (t_{OSHL}) or LOW-to-HIGH (t_{OSLH}) or in opposite directions both HL and LH (t_{OST}). This parameter is guaranteed by design and statistical process distribution. Actual skew values between the GTLP outputs could vary on the backplane due to the loading and impedance seen by the device.

Note 15: t_{PV} - Part to part skew is defined as the absolute value of the difference between the actual propagation delay for all outputs from device to device. The parameter is specified for a specific worst case V_{CC} and temperature. This parameter is guaranteed by design and statistical process distribution. Actual skew values between the GTLP outputs could vary on the backplane due to the loading and impedance seen by the device.

Note 16: Due to the open drain structure on GTLP outputs t_{OST} and $t_{PV(LH)}$ in the A-to-B direction are not specified. Skew on these paths is dependent on the V_{TT} and R_T values on the backplane.

Test Circuits and Timing Waveforms

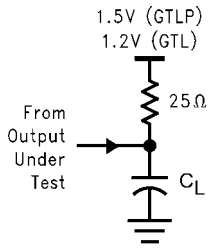
Test Circuit for A Outputs



Test	S
t_{PLH}/t_{PHL}	Open
t_{PLZ}/t_{PZL}	6V
t_{PHZ}/t_{PZH}	GND

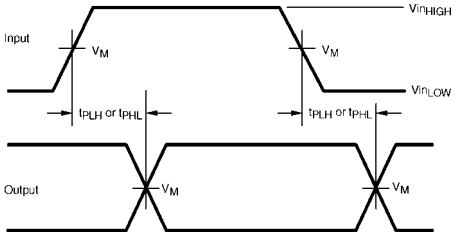
Note A: C_L includes probes and Jig capacitance.

Test Circuit for B Outputs

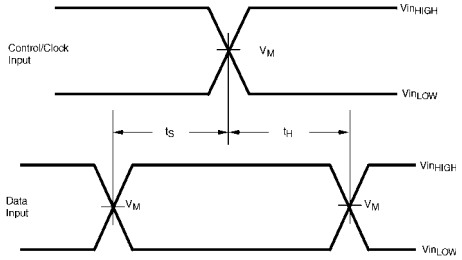


Note B: For B Port, C_L = 30 pF or 10 pF.

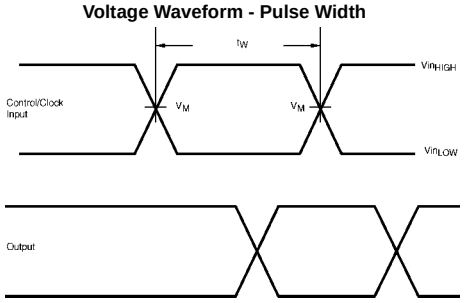
Voltage Waveform - Propagation Delay Times



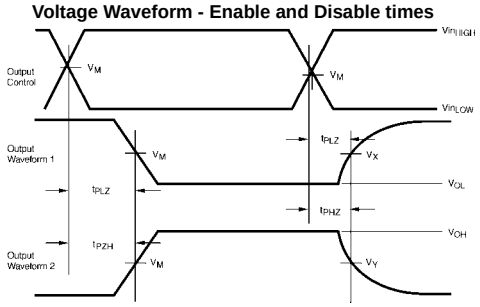
Voltage Waveform - Setup and Hold Times



Voltage Waveform - Pulse Width



Voltage Waveform - Enable and Disable times



Output Waveform 1 is for an output with internal conditions such that the output is LOW except when disabled by the control output.

Output Waveform 2 is for an output with internal conditions such that the output is HIGH except when disabled by the control output.

Input and Measure Conditions

	A or LVTTL Pins	B or GTLP Pins
V_{inHIGH}	V_{CC}	1.5
V_{inLOW}	0.0	0.0
V_M	$V_{CC}/2$	1.0
V_X	V_{OL} + 0.3V	N/A
V_Y	V_{OH} − 0.3V	N/A

All input pulses have the following characteristics: Frequency = 10MHz, $t_{RISE} = t_{FALL}$ = 2 ns (10% to 90%), Z_O = 50Ω

The outputs are measured one at a time with one transition per measurement.

LIFE SUPPORT POLICY

FAIRCHILD'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF THE PRESIDENT OF FAIRCHILD SEMICONDUCTOR CORPORATION. As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, and (c) whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury to the user.
2. A critical component in any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.
