

## Features

- Operating voltage: 2.7V~5.5V
- Low power consumption
  - Operation: 25mA Max. (V<sub>CC</sub>=5V)  
10mA Max. (V<sub>CC</sub>=3V)
  - Standby: 30μA Max. (V<sub>CC</sub>=5V)  
10μA Max. (V<sub>CC</sub>=3V)
- Access time: 150ns Max. (V<sub>CC</sub>=5V)  
250ns Max. (V<sub>CC</sub>=3V)
- 65536×8 bits of mask ROM
- Mask options: chip enable CE/CĒ/OE1/OĒ1 and output enable OE/OĒ/NC
- TTL compatible inputs and outputs
- Tristate outputs
- Fully static operation
- Package type: 28-pin DIP/SOP

## General Description

The HT23C512 is a read-only memory with high performance CMOS storage device whose 512K of memory is arranged into 65536 words by 8 bits.

For application flexibility, the chip enable and output enable control pins can be selected as active high or active low. This flexibility not only allows easy interface with most microproces-

sors, but also eliminates bus contention in multiple bus microprocessor systems. An additional feature of the HT23C512 is its ability to enter the standby mode whenever the chip enable (CE/CĒ) is inactive, thus reducing current consumption to below 30μA. The combination of these functions makes the chip suitable for high density low power memory applications.

## Block Diagram

### Pin Assignment

### Pin Description

Pin Name	I/O	Description
A0~A15	I	Address inputs
D0~D7	O	Data outputs
CE/CE/OE1/OE1	I	Chip enable/Output enable input
OE/OE/NC	I	Output enable input
VSS	I	Negative power supply
VDD	I	Positive power supply

### Operation Truth Table

Mode	CE/CE	OE/OE	A0~A15	D0~D7
Read	H/L	H/L	Valid	Data Out
Deselect	H/L	L/H	X	High Z
Standby	L/H	X	X	High Z

Note: H=V<sub>IH</sub>, L=V<sub>IL</sub>, X=V<sub>IH</sub> or V<sub>IL</sub>

**Absolute Maximum Ratings\***

Supply Voltage .....	-0.3V to 6V	Storage Temperature.....	-50°C to 125°C
Input Voltage.....	-0.3V to V <sub>CC</sub> +0.3V	Operating Temperature.....	-40°C to 85°C

\*Note: These are stress ratings only. Stresses exceeding the range specified under "Absolute Maximum Ratings" may cause substantial damage to the device. Functional operation of this device at other conditions beyond those listed in the specification is not implied and prolonged exposure to extreme conditions may affect device reliability.

### A.C. test conditions

Output load: see figure right

Input rise and fall time: 10ns

Input pulse levels: 0.4V to 2.4V

Input and output timing reference levels:

0.8V and 2.0V (V<sub>CC</sub>=5V)

1.5V (V<sub>CC</sub>=3V)

\* Including scope and jig

Output load circuit

## Functional Description

The HT23C512 has two modes, namely data read mode and standby mode, controlled by CE/CE<sub>1</sub>/OE<sub>1</sub>/OE<sub>1</sub> and OE/OE/NC inputs.

- **Standby mode**

The HT23C512 has lower current consumption, controlled by the chip enable input (CE/CĒ). When a low/high level is applied to the CE/CĒ input regardless of the output enable (OE/OĒ/NC) states, the chip will enter the standby mode.

- **Data read mode**

When both the chip enable (CE/CĒ/OE<sub>1</sub>/OE<sub>1</sub>) and the output enable (OE/OĒ/NC) are active, the chip is in data read mode. Otherwise, active CE/CĒ and inactive OE/OĒ/NC result in deselect mode. The output will remain in Hi-Z state.

## Timing Diagrams

- Propagation delay due to address (CE/CĒ/OE<sub>1</sub>/OE<sub>1</sub> and OE/OĒ are active)

- Propagation delay due to chip enable and output enable (address valid)
