

Description

The GM71V65400C is the second generation dynamic RAM organized 16,777,216 words by 4 bits. The GM71V65400C utilizes 0.35um CMOS Silicon Gate Process Technology as well as advanced circuit techniques for wide operating margins, both internally and to the system user. System oriented features include single power supply of 3.3V; $\pm 3\%$ tolerance, direct interfacing capability with high performance logic families such as Schottky TTL.

The GM71V65400C offers Fast Page Mode as a high speed access mode.

Features

Notes:

1. AC Measurements assume $t_r = 5\text{ns}$.
2. Assumes that $t_{RCDj} \hat{A}_{RCD(max)}$ and $t_{RADj} \hat{A}_{RAD(max)}$. If t_{RCD} or t_{RAD} is greater than the maximum recommended value shown in this table, t_{RAC} exceeds the value shown.
3. Measured with a load circuit equivalent to 1 TTL loads and 100 Ω .
4. Assumes that $t_{RCDj} \hat{A}_{RCD(max)}$ and $t_{RADj} \hat{A}_{RAD(max)}$.
5. Assumes that $t_{RCDj} \hat{A}_{RCD(max)}$ and $t_{RADj} \hat{A}_{RAD(max)}$.
6. $t_{OFF(max)}$ defines the time at which the output achieves the open circuit condition and is not referenced to output voltage levels.
7. $V_{IH(min)}$ and $V_{IL(max)}$ are reference levels for measuring timing of input signals. Also, transition times are measured between V_{IH} and V_{IL} .
8. Operation with the $t_{RCD(max)}$ limit insures that $t_{RAC(max)}$ can be met, $t_{RCD(max)}$ is specified as a reference point only; if t_{RCD} is greater than the specified $t_{RCD(max)}$ limit, then access time is controlled exclusively by t_{CAC} .
9. Operation with the $t_{RAD(max)}$ limit insures that $t_{RAC(max)}$ can be met, $t_{RAD(max)}$ is specified as a reference point only; if t_{RAD} is greater than the specified $t_{RAD(max)}$ limit, then access time is controlled exclusively by t_{AA} .

10. t_{WCS} , t_{RWD} , t_{CWD} , t_{CPW} and t_{AWD} are not restrictive operating parameters. They are included in the data sheet as electrical characteristics only; if $t_{WCS} \leq \bar{A}_{WCS}(\min)$, the cycle is an early write cycle and the data out pin will remain open circuit (high impedance) throughout the entire cycle; if $t_{RWD} \leq \bar{A}_{AWD}(\min)$, $t_{CWD} \leq \bar{A}_{AWD}(\min)$, $t_{AWD} \leq \bar{A}_{AWD}(\min)$ and $t_{CPW} \leq \bar{A}_{CPW}(\min)$, the cycle is a read-modify-write and the data output will contain data read from the selected cell; if neither of the above sets of conditions is satisfied, the condition of the data out (at access time) is indeterminate.
11. These parameters are referenced to \overline{CAS} leading edge in early write cycles and to \overline{WE} leading edge in delayed write or a read modify write cycle.
12. t_{RASP} defines \overline{RAS} pulse width in fast page mode cycles.
13. Access time is determined by the longer of t_{AA} or t_{CAC} or t_{ACP} .
14. An initial pause of 100 μ s required after power up followed by a minimum of eight initialization cycles (\overline{RAS} only refresh cycle or \overline{CAS} before \overline{RAS} refresh cycle). If the internal refresh counter is used, a minimum of eight \overline{CAS} before \overline{RAS} refresh cycles is required.
15. In delayed write or read-modify-write cycles, \overline{OE} must disable output buffer prior to applying data to the device.
16. Test mode operation specified in this data sheet is 2-bit test function controlled by control address bits - - - CA0. This test mode operation can be performed by \overline{WE} -and- \overline{CAS} -before- \overline{RAS} (WCBR) refresh cycle. Refresh during test mode operation will be performed by normal read cycles or by WCBR refresh cycles. When the state of two test bits accord each other, the condition of the output data is high level. When the state of two test bits do not accord, the condition of the output data is low level. In order to end this test mode operation, perform a \overline{RAS} only refresh cycle or a \overline{CAS} -before- \overline{RAS} refresh cycle.
17. In a test mode read cycle, the value of t_{RAC} , t_{AA} , t_{CAC} , t_{OAC} and t_{ACP} is delayed for 2ns to 5ns for the specified value. These parameters should be specified in test mode cycles by adding the above value to the specified value in this data sheet.
