

## 8Mb (256Kx36 & 512Kx18) and 4Mb (128Kx36 & 256Kx18) SRAM

---

### Features

- 8Mb: 256K x 36 or 512K x 18 organizations  
4Mb: 128K x 36 or 256K x 18 organizations
- 0.25 Micron CMOS technology
- Synchronous pipeline mode of operation with self-timed late write
- Differential PECL clocks or 2.5V LVTTTL swing with one clock tied to  $V_{DDQ}/2$
- +3.3V power supply, ground, 2.5V  $V_{DDQ}$
- 2.5V LVTTTL input and output levels
- Registered addresses, write enables, synchronous select, and data ins
- Registered outputs
- 30  $\Omega$  drivers
- Common I/O
- Asynchronous output enable
- Synchronous power down input
- Boundary scan using limited set of JTAG 1149.1 functions
- Byte write capability and global write enable
- 7 x 17 bump ball grid array package with SRAM JEDEC standard pinout and boundary SCAN order

### Description

The 4Mb and 8Mb SRAMs—IBM0436A41NLAB, IBM0418A41NLAB, IBM0418A81NLAB, and IBM0436A81NLAB—are synchronous pipeline mode, high-performance CMOS static random-access memories that are versatile, have wide I/O, and can achieve 3.0ns cycle times. Differential K clocks are used to initiate the read/write operation and all internal operations are self-timed. At the ris-

ing edge of the K clock, all addresses, write-enables, synchronous select, and data ins are registered internally. Data outs are updated from output registers on the next rising edge of the K clock. An internal write buffer allows write data to follow one cycle after addresses and controls. The device is operated with a single +3.3V power supply and is compatible with a 2.5V LVTTTL I/O interface.

## SRAM Features

### Late Write

The late write function allows for write data to be registered one cycle after addresses and controls. This feature eliminates one bus-turnaround cycle, necessary when going from a read to a write operation. Late write is accomplished by buffering write addresses and data so that the write operation occurs during the next write cycle. When a read cycle occurs after a write cycle, the address and write data information are stored temporarily in holding registers. During the first write cycle preceded by a read cycle, the SRAM array will be updated with address and data from the holding registers. Read cycle addresses are monitored to determine if read data is to be supplied from the SRAM array or the write buffer. The bypassing of the SRAM array occurs on a byte-by-byte basis. When only one byte is written during a write cycle, read data from the last written address will have new byte data from the write buffer and remaining bytes from the SRAM array.

### Mode Control

Mode control pins M1 and M2 are used to select four different JEDEC-standard read protocols. This SRAM supports a single clock pipeline ( $M1 = V_{SS}$ ,  $M2 = V_{DD}$ ). This datasheet only describes single-clock pipeline functionality. Mode control inputs must be set on power up and must not change during SRAM operation. This SRAM is tested only in the pipeline mode.

### Sleep Mode

Sleep mode is enabled by switching synchronous signal ZZ high. When the SRAM is in sleep mode, the outputs will go to a High-Z state and the SRAM will draw standby current. SRAM data will be preserved and a recovery time ( $t_{ZZR}$ ) is required before the SRAM resumes normal operation.

### Power-Up Requirements

In order to guarantee the optimum internally regulated supply voltage, the SRAM requires 4 $\mu$ s of power-up time after  $V_{DD}$  reaches its operating range.

### Power-Up and Power-Down Sequencing

The power supplies need to be powered up in the following order:  $V_{DD}$ ,  $V_{DDQ}$ , and inputs. The power-down sequencing must be in the reverse order.  $V_{DDQ}$  can be allowed to exceed  $V_{DD}$  by no more than 0.6V.

1. Stresses greater than those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.
2. Excludes DQ inputs.

### Recommended DC Operating Conditions ( $T_A = 0$ to $+85^\circ\text{C}$ )

## IEEE 1149.1 TAP and Boundary Scan

The SRAM provides a limited set of JTAG functions intended to test the interconnection between SRAM I/Os and printed circuit-board traces or other components. There is no multiplexer in the path from I/O pins to the RAM core.

In conformance with IEEE Standard 1149.1, the SRAM contains a TAP controller, instruction register, boundary scan register, bypass register, and ID register.

The TAP controller has a standard 16-state machine that resets internally upon power-up; therefore, a TRST signal is not required.

### Signal List

- TCK: Test Clock
- TMS: Test Mode Select
- TDI: Test Data In
- TDO: Test Data Out

## JTAG DC Operating Characteristics ( $T_A = 0$ to $+85^\circ\text{C}$ )

Operates with JEDEC Standard JESD8A (3.3V) logic signal levels

Parameter	Symbol	Min.	Typ.	Max.	Units	Notes
JTAG Input High Voltage	$V_{IH1}$	2.2	—	$V_{DD} + 0.3$	V	1
JTAG Input Low Voltage	$V_{IL1}$	-0.3	—	0.8	V	1
JTAG Output High Level	$V_{OH1}$	2.4	—	—	V	1, 2
JTAG Output Low Level	$V_{OL1}$	—	—	0.4	V	1, 3

1. All JTAG inputs and outputs are LVTTTL compatible only.  
2.  $I_{OH1} \geq -18\text{mA}$ .  
3.  $I_{OL1} \geq +18\text{mA}$ .

## JTAG AC Test Conditions ( $T_A = 0$ to $+85^\circ\text{C}$ , $V_{DD} = 3.3\text{V} -5\%, +10\%$ )

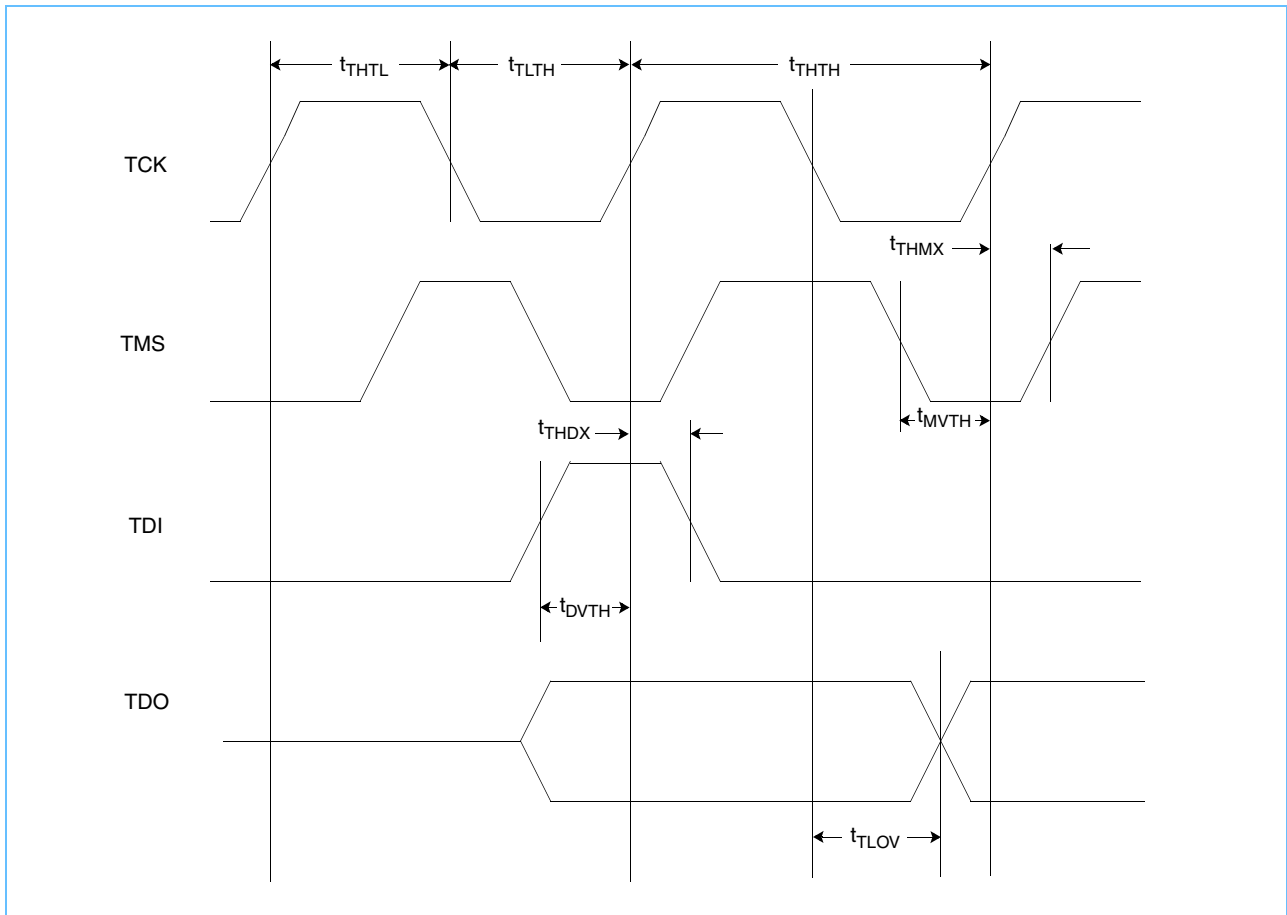

Parameter	Symbol	Conditions	Units
Input Pulse High Level	$V_{IH1}$	3.0	V
Input Pulse Low Level	$V_{IL1}$	0.0	V
Input Rise Time	$T_{R1}$	2.0	ns
Input Fall Time	$T_{F1}$	2.0	ns
Input and Output Timing Reference Level		1.5	V

**JTAG AC Characteristics** ( $T_A = 0$  to  $+85^\circ\text{C}$ ,  $V_{DD} = 3.3\text{V} -5\%, +10\%$ )

Parameter	Symbol	Min.	Max.	Units	Notes
TCK Cycle Time	$t_{THTH}$	20	—	ns	
TCK High Pulse Width	$t_{THTL}$	7	—	ns	
TCK Low Pulse Width	$t_{TLTH}$	7	—	ns	
TMS Setup	$t_{MVTH}$	4	—	ns	
TMS Hold	$t_{THMX}$	4	—	ns	
TDI Setup	$t_{DVTH}$	4	—	ns	
TDI Hold	$t_{THDX}$	4	—	ns	
TCK Low to Valid Data	$t_{TLOV}$	—	7	ns	1

## Scan Register Definition

Register Name	Bit Size x18	Bit Size x36
Instruction	3	3
Bypass	1	1
ID	32	32
Boundary Scan <sup>1, 2</sup>	51	70

1. The boundary scan chain consists of the following bits:

- 36 or 18 bits for data inputs, depending on x18 or x36 configuration
- 18 bits for SA0 - SA17 in x36, 19 bits for SA0 - SA18 in x18
- 4 bits for  $\overline{SBW}a$  -  $\overline{SBW}d$  in x36, 2 bits for  $\overline{SBW}a$  and  $\overline{SBW}b$  in x18
- 8 bits for K,  $\overline{K}$ ,  $\overline{SS}$ ,  $\overline{G}$ ,  $\overline{SW}$ , ZZ, M1, and M2
- 4 bits for place holders for 8 Mb, 5 bits for place holders for 4Mb

2. K and  $\overline{K}$  clocks connect to a differential receiver that generates a single-ended clock signal. This signal and its inverted value are used for boundary-scan sampling.

## ID Register Definition

Part	Field Bit Number and Description

## Instruction Set

Code	Instruction	Notes
000	SAMPLE-Z	1
001	IDCODE	
010	SAMPLE-Z	1
011	PRIVATE	5
100	SAMPLE	4
101	PRIVATE	5
110	PRIVATE	5
111	BYPASS	2, 3

1. Places DQs in High-Z in order to sample all input data regardless of other SRAM inputs.
2. TDI is sampled as an input to the first ID register, to allow for the serial shift of the external TDI data.
3. The BYPASS register is initiated to  $V_{SS}$  when the BYPASS instruction is invoked. The BYPASS register also holds the last serially loaded TDI when exiting the Shift DR state.
4. The SAMPLE instruction does not place DQs in High-Z.
5. This instruction is reserved for the exclusive use of IBM. Invoking this instruction will cause improper SRAM functionality.

This part is not designed to comply with the following sections of IEEE 1149.1:

- 7.2.1.b, e
- 7.7.1.a-f
- 10.1.1.b, e
- 10.7.1.a-d
- 6.1.1.d

## Revision Log

Revision	Contents of Modification
04/05/2000	Initial release for RR 2.5V I/O
04/9/2000	Corrected typos.
04/14/2000	See x18 BGA Pinout on page 2 and See x36 BGA Pinout on page 2. - Mode pins were specified incorrectly. They now match RR operation.
05/03/2000	See AC Characteristics on page 11. - $t_{KHDX} = 1.0\text{ns}$ . Specification was previously incorrect. - $t_{KHQX} = 0.7\text{ns}$ . Guaranteed by design and tested without guardbands (see footnote 3).
05/16/00	Added copyright and disclaimer.
05/18/00	Fixed unresolved cross-references and added preliminary statements.
05/19/2000	Updated table formats on pages 4 and 11.
07/07/2000	Adjusted first page layout and right page header alignment. Corrected minor typos.
12/19/2000	Rev. 05. Made various minor editorial changes and format refinements.
1/16/2002	Rev.06. See Recommended DC Operating Conditions figure on page 8. Added single-ended Clock operation specs.
06/13/2002	Revised footers. Other minor changes to format and wording. Removed preliminary classification.
