ICS9248-127

Frequency Generator & Integrated Buffers for PENTIUM/Pro™

General Description

The **ICS9248-127** is the single chip clock solution for Desktop designs using the VIA MVP4 and Aladdin 7 style chipset. It provides all necessary clock signals for such a system.

Spread spectrum may be enabled through I²C programming. Spread spectrum typically reduces system EMI by 8dB to 10dB. This simplifies EMI qualification without resorting to board design iterations or costly shielding. The **ICS9248-127** employs a proprietary closed loop design, which tightly controls the percentage of spreading over process and temperature variations.

Features

- Up to 124MHz frequency support.
- Spread Spectrum for EMI control 0 to -0.5% down spread and ±0.25% center spread
- Serial I²C interface for Power Management, Frequency Select, Spread Spectrum.
- Provides the following system clocks
  - 4-CPUs @ 3.3V, up to 124MHz.
  - 13-SDRAMs @3.3V, up to 124MHz (including SDRAM_F)
  - 6-PCI (including 1 free running, PCICLK_F) @3.3V, CPU/2 or CPU/3.
  - 1-24MHz @3.3V fixed.
  - 1-48MHz @3.3V fixed.
  - 2-REF @3.3V, 14.318MHz.
- Efficient Power management scheme through PCI and STOP CLOCKS.

Pin Descriptions

PIN NUMBER	PIN NAME	TYPE	DESCRIPTION
1, 6, 14, 19, 27, 30, 36, 47	VDD	PWR	3.3V power supply
2	REF0	OUT	14.318 Mhz reference clock.This REF output is the STRONGER buffer for ISA BUS loads
	PCI_STOP#[1]	IN	Halts PCICLK clocks at logic 0 level, when input low (In mobile mode, MODE=0)
3,9,16,22, 33,40,44	GND	PWR	Ground
4	X1	IN	Crystal input, has internal load cap (36pF) and feedback resistor from X2
5	X2	OUT	Crystal output, nominally 14.318MHz.
7	PCICLK_F	OUT	Free running PCI clock not affected by PCI_STOP# for power management.
	MODE[1, 2]	IN	pin 2 function select pin, 1=Desktop Mode, 0=Mobile Mode. Latched Input.
8	FS3[1]	IN	Frequency select pin. Latched Input.
	PCICLK0	OUT	PCI clock outputs. Syncheronous to CPU clocks with 1-4ns skew (CPU early)
13, 12, 11, 10	PCICLK (4:1)	OUT	PCI clock outputs. Syncheronous to CPU clocks with 1-4ns skew (CPU early)
15	BUFFER IN	IN	Input to Fanout Buffers for SDRAM outputs.
17, 18, 20, 21, 28, 29, 31, 32, 34, 35, 37, 38	SDRAM (11:0)	OUT	SDRAM clock outputs, Fanout Buffer outputs from BUFFER IN pin (controlled by chipset).
23	SDATA	I/O	Data pin for I^2C circuitry 5V tolerant
24	SCLK	IN	Clock pin of I^2C circuitry 5V tolerant
25	24MHz	OUT	24MHz output clock
	FS1[1, 2]	IN	Frequency select pin. Latched Input.
26	48MHz	OUT	48MHz output clock
	FS0[1, 2]	IN	Frequency select pin. Latched Input
39	SDRAM_F	OUT	Free running SDRAM clock output. Not affected by CPU_STOP#
41	CLK_STOP#	IN	This asynchronous input halts CPUCLK & SDRAM at logic "0" level when driven low.
42, 43, 45	CPUCLK (2:0)	OUT	CPU clock outputs, powered by VDDCPU
46	CPUCLK_F	OUT	Free running CPU clock. Not affected by the CPU_STOP#
48	REF1	OUT	14.318 MHz reference clock.
	FS2[1, 2]	IN	Frequency select pin. Latched Input

Notes:

1: Internal Pull-up Resistor of 240K to 3.3V on indicated inputs

2: Bidirectional input/output pins, input logic levels are latched at internal power-on-reset. Use 10Kohm resistor to program logic Hi to VDD or GND for logic low.

Notes:

1. The ICS clock generator is a slave/receiver, I^2C component. It can read back the data stored in the latches for verification. **Read-Back will support Intel PIIX4 "Block-Read" protocol**.
2. The data transfer rate supported by this clock generator is 100K bits/sec or less (standard mode)
3. The input is operating at 3.3V logic levels.
4. The data byte format is 8 bit bytes.
5. To simplify the clock generator I^2C interface, the protocol is set to use only "**Block-Writes**" from the controller. The bytes must be accessed in sequential order from lowest to highest byte with the ability to stop after any complete byte has been transferred. The Command code and Byte count shown above must be sent, but the data is ignored for those two bytes. The data is loaded until a Stop sequence is issued.
6. At power-on, all registers are set to a default condition, as shown.

Shared Pin Operation - Input/Output Pins

The I/O pins designated by (input/output) on the ICS9248-127 serve as dual signal functions to the device. During initial power-up, they act as input pins. The logic level (voltage) that is present on these pins at this time is read and stored into a 5-bit internal data latch. At the end of Power-On reset, (see AC characteristics for timing values), the device changes the mode of operations for these pins to an output function. In this mode the pins produce the specified buffered clocks to external loads.

To program (load) the internal configuration register for these pins, a resistor is connected to either the VDD (logic 1) power supply or the GND (logic 0) voltage potential. A 10 Kilohm (10K) resistor is used to provide both the solid CMOS programming voltage needed during the power-up programming period and to provide an insignificant load on the output clock during the subsequent operating period.

Figure 1 shows a means of implementing this function when a switch or 2 pin header is used. With no jumper is installed the pin will be pulled high. With the jumper in place the pin will be pulled low. If programmability is not necessary, than only a single resistor is necessary. The programming resistors should be located close to the series termination resistor to minimize the current loop area. It is more important to locate the series termination resistor close to the driver than the programming resistor.

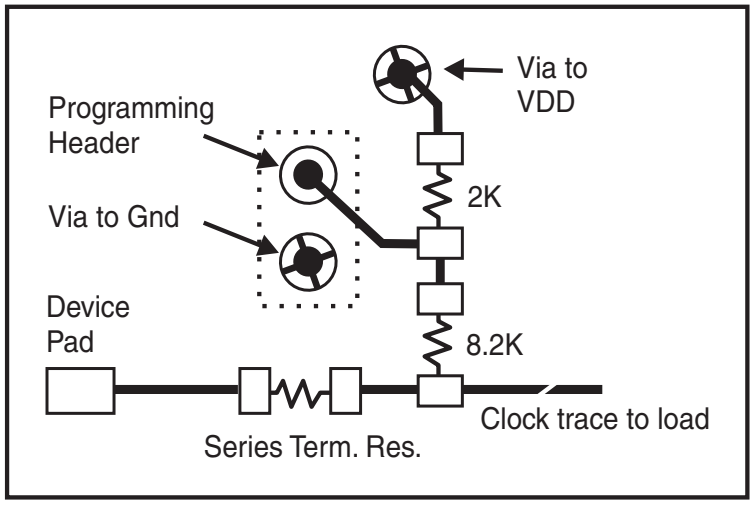

Fig. 1

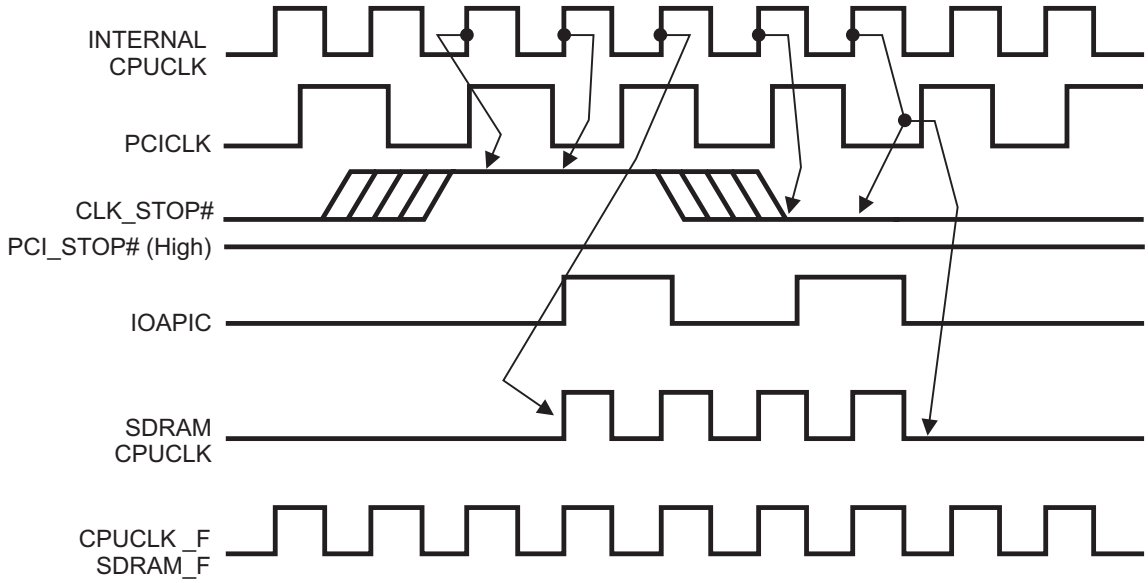
CLK_STOP# Timing Diagram

CLK_STOP# is an asychronous input to the clock synthesizer. It is used to turn off the CPU clocks for low power operation. CLK_STOP# is synchronized by the **ICS9248-127**. The minimum that the CPU clock is enabled (CPU_STOP# high pulse) is 100 CPU clocks. All other clocks will continue to run while the CPU clocks are disabled. The CPU clocks will always be stopped in a low state and start in such a manner that guarantees the high pulse width is a full pulse. CPU clock on latency is less than 4 CPU clocks and CPU clock off latency is less than 4 CPU clocks.

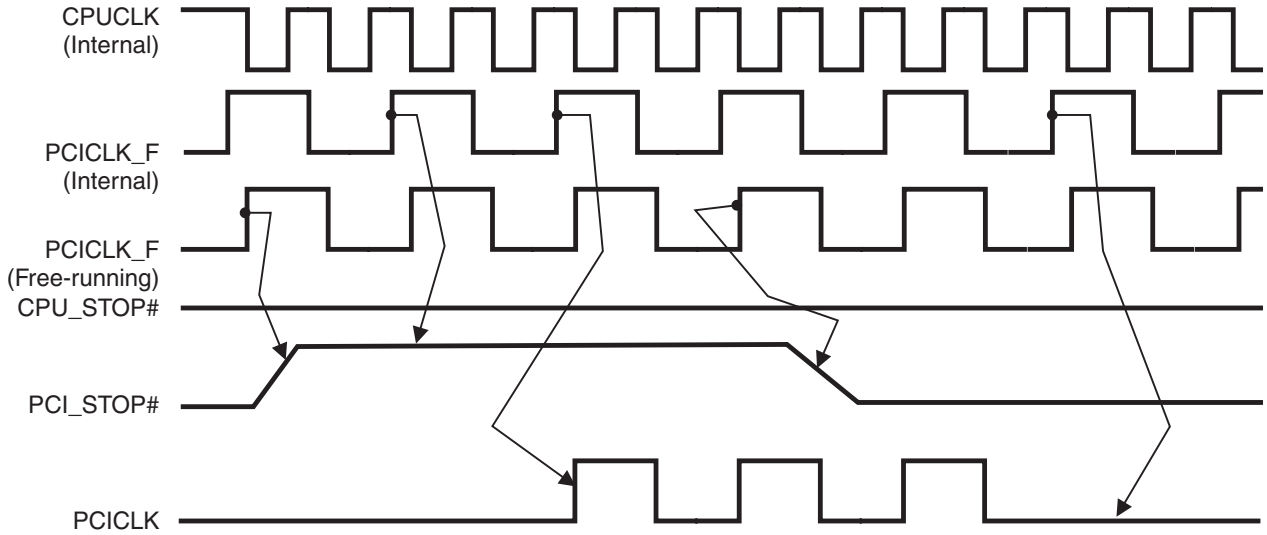


Notes:

1. All timing is referenced to the internal CPU clock.
2. CLK_STOP# is an asynchronous input and metastable conditions may exist. This signal is synchronized to the CPU clocks inside the ICS9248-127.
3. IOAPIC output is Stopped Glitch Free by CPUSTOP# going low.
4. SDRAM-F output is controlled by Buffer in signal, not affected by the **ICS9248-127** CLK_STOP# signal. SDRAM (0:11) are controlled as shown.
5. All other clocks continue to run undisturbed.

PCI_STOP# Timing Diagram

PCI_STOP# is an asynchronous input to the **ICS9248-127**. It is used to turn off the PCICLK [4:0] clocks for low power operation. PCI_STOP# is synchronized by the **ICS9248-127** internally. The minimum that the PCICLK [4:0] clocks are enabled (PCI_STOP# high pulse) is at least 10 PCICLK [4:0] clocks. PCICLK [4:0] clocks are stopped in a low state and started with a full high pulse width guaranteed. PCICLK [4:0] clock on latency cycles are only one rising PCICLK clock off latency is one PCICLK clock.



Notes:

1. All timing is referenced to the Internal CPUCLK (defined as inside the ICS9248 device.)
2. PCI_STOP# is an asynchronous input, and metastable conditions may exist. This signal is required to be synchronized inside the ICS9248.
3. All other clocks continue to run undisturbed.
4. CPU_STOP# is shown in a high (true) state.
