Typ: Propagation Delay Time		Bypass Mode CLK to any output		4		ns
Slew Rate	t_{SLEW}	Load = 120Ω/14pF	1	1.8	2	V/ns

Notes:

1. Refers to transition on noninverting output.
2. While the pulse skew is almost constant over frequency, the duty cycle error increases at higher frequencies. This is due to the formula: duty cycle=t_{WH}/t_C, were the cycle (t_C) decreases as the frequency goes up.

Notes:

1. The ICS clock generator is a slave/receiver, I^2C component. It can read back the data stored in the latches for verification. **Read-Back will support Intel PIIX4 "Block-Read" protocol**.
2. The data transfer rate supported by this clock generator is 100K bits/sec or less (standard mode)
3. The input is operating at 3.3V logic levels.
4. The data byte format is 8 bit bytes.
5. To simplify the clock generator I^2C interface, the protocol is set to use only "**Block-Writes**" from the controller. The bytes must be accessed in sequential order from lowest to highest byte with the ability to stop after any complete byte has been transferred. The Command code and Byte count shown above must be sent, but the data is ignored for those two bytes. The data is loaded until a Stop sequence is issued.
6. At power-on, all registers are set to a default condition, as shown.

Recommended Layout for the ICS93V850

General Layout Precautions:

Use copper flooded ground on the top signal layer under the clock buffer The area under U1 on the right is an example. Flood over the ground vias.

1) Use power vias for power and ground. Vias 20 mil or larger in diameter have lower high frequency impedance. Vias for signals may be minimum drill size.
2) Make all power and ground traces are as wide as the via pad for lower inductance.
3) VAA for pin 16 has a low pass RC filter to decouple the digital and analog supplies. The 4.7uF capacitors may be replaced with a single low ESR device with the same total capacitance. VAA is routed on a outside signal layer. Do not cut a power or ground plane and route in it.
4) Notice that ground vias are never shared.
5) When ever possible, VCC (net V2P5 in the schematic) pins have a decoupling capacitor. Power is always routed from the plane connection via to the capacitor pad to the VCC pin on the clock buffer. Moats or plane cuts are not used to isolate power.
6) Differential mode clock output traces are routed:
   a. With a ground trace between the pairs. Trace is grounded on both ends.
   b. Without a ground trace, clock pairs are routed with a separation of at least 5 times the thickness of the dielectric. If the dielectric thickness is 4.5 mil, the trace separation is at least 18 mils.
7) Terminate differential CLK_IN and FB_IN traces after routing to buffer pads.
