Features

- ◆ 128K x 36, 256K x 18 memory configurations
- ◆ Supports fast access times:
 - Commercial:*
 - 7.5ns up to 117MHz clock frequency
 - Commercial and Industrial:*
 - 8.0ns up to 100MHz clock frequency
 - 8.5ns up to 87MHz clock frequency
- ◆ LBO input selects interleaved or linear burst mode
- ◆ Self-timed write cycle with global write control (\overline{GW}), byte write enable (\overline{BWE}), and byte writes (\overline{BWx})
- ◆ 3.3V core power supply
- ◆ Power down controlled by ZZ input
- ◆ 2.5V I/O
- ◆ Packaged in a JEDEC Standard 100-pin plastic thin quad flatpack (TQFP), 119 ball grid array (BGA) and 165 fine pitch ball grid array (fBGA)

Description

The IDT71V2577/79 are high-speed SRAMs organized as 128K x 36/256K x 18. The IDT71V2577/79 SRAMs contain write, data, address and control registers. There are no registers in the data output path (flow-through architecture). Internal logic allows the SRAM to generate a self-timed write based upon a decision which can be left until the end of the write cycle.

The burst mode feature offers the highest level of performance to the system designer, as the IDT71V2577/79 can provide four cycles of data for a single address presented to the SRAM. An internal burst address counter accepts the first cycle address from the processor, initiating the access sequence. The first cycle of output data will flow-through from the array after a clock-to-data access time delay from the rising clock edge of the same cycle. If burst mode operation is selected ($ADV=LOW$), the subsequent three cycles of output data will be available to the user on the next three rising clock edges. The order of these three addresses are defined by the internal burst counter and the \overline{LBO} input pin.

The IDT71V2577/79 SRAMs utilize IDT's latest high-performance CMOS process and are packaged in a JEDEC standard 14mm x 20mm 100-pin thin plastic quad flatpack (TQFP) as well as a 119 ball grid array (BGA) and a 165 fine pitch ball grid array (fBGA).

Pin Definition⁽¹⁾

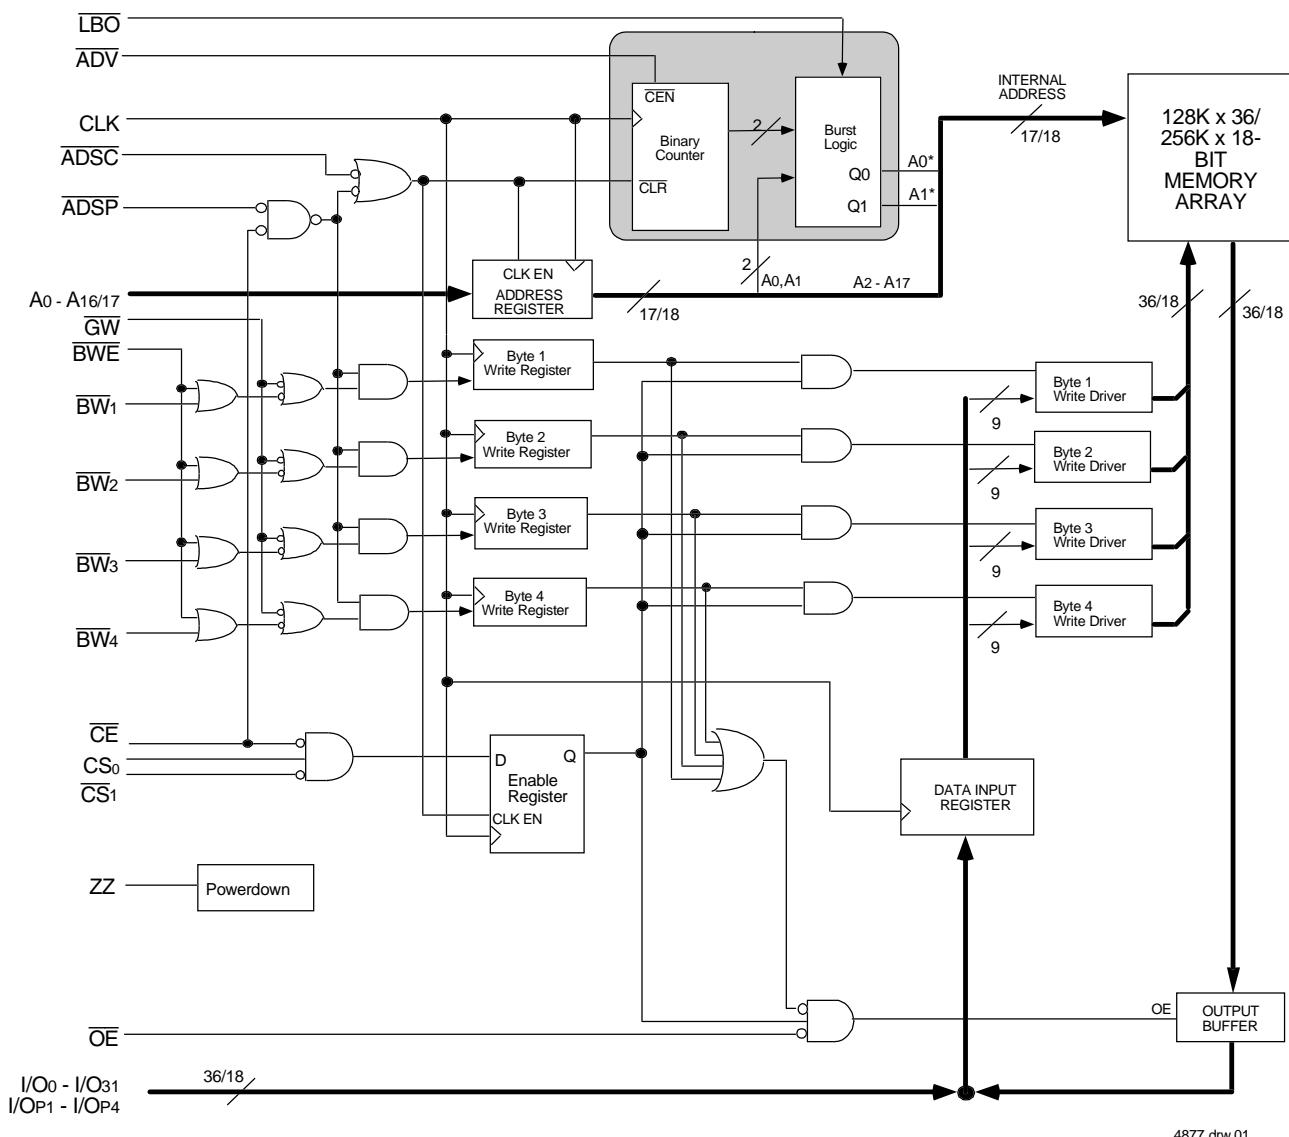

Symbol	Pin Function	I/O	Active	Description
A ₀ -A ₁₇	Address Inputs	I	N/A	Synchronous Address inputs. The address register is triggered by a combination of the rising edge of CLK and \overline{ADSC} Low or \overline{ADSP} Low and \overline{CE} Low.
\overline{ADSC}	Address Status (Cache Controller)	I	LOW	Synchronous Address Status from Cache Controller. \overline{ADSC} is an active LOW input that is used to load the address registers with new addresses.
\overline{ADSP}	Address Status (Processor)	I	LOW	Synchronous Address Status from Processor. \overline{ADSP} is an active LOW input that is used to load the address registers with new addresses. \overline{ADSP} is gated by \overline{CE} .
\overline{ADV}	Burst Address Advance	I	LOW	Synchronous Address Advance. \overline{ADV} is an active LOW input that is used to advance the internal burst counter, controlling burst access after the initial address is loaded. When the input is HIGH the burst counter is not incremented; that is, there is no address advance.
\overline{BWE}	Byte Write Enable	I	LOW	Synchronous byte write enable gates the byte write inputs $\overline{BW1}$ - $\overline{BW4}$. If \overline{BWE} is LOW at the rising edge of CLK then BWx inputs are passed to the next stage in the circuit. If \overline{BWE} is HIGH then the byte write inputs are blocked and only GW can initiate a write cycle.
$\overline{BW1}$ - $\overline{BW4}$	Individual Byte Write Enables	I	LOW	Synchronous byte write enables. $\overline{BW1}$ controls I/O ₀ - ₇ , I/O ₁ , $\overline{BW2}$ controls I/O ₈ - ₁₅ , I/O ₂ , etc. Any active byte write causes all outputs to be disabled.
\overline{CE}	Chip Enable	I	LOW	Synchronous chip enable. \overline{CE} is used with CS ₀ and CS ₁ to enable the IDT71V2577/79. \overline{CE} also gates \overline{ADSP} .
CLK	Clock	I	N/A	This is the clock input. All timing references for the device are made with respect to this input.
CS ₀	Chip Select 0	I	HIGH	Synchronous active HIGH chip select. CS ₀ is used with \overline{CE} and CS ₁ to enable the chip.
CS ₁	Chip Select 1	I	LOW	Synchronous active LOW chip select. CS ₁ is used with \overline{CE} and CS ₀ to enable the chip.
\overline{GW}	Global Write Enable	I	LOW	Synchronous global write enable. This input will write all four 9-bit data bytes when LOW on the rising edge of CLK. \overline{GW} supersedes individual byte write enables.
I/O ₀ -I/O ₃₁ I/O ₁ -I/O ₄	Data Input/Output	I/O	N/A	Synchronous data input/output (I/O) pins. The data input path is registered, triggered by the rising edge of CLK. The data output path is flow-through (no output register).
\overline{LBO}	Linear Burst Order	I	LOW	Asynchronous burst order selection input. When \overline{LBO} is HIGH, the inter-leaved burst sequence is selected. When \overline{LBO} is LOW the Linear burst sequence is selected. \overline{LBO} is a static input and must not change state while the device is operating.
\overline{OE}	Output Enable	I	LOW	Asynchronous output enable. When \overline{OE} is LOW the data output drivers are enabled on the I/O pins if the chip is also selected. When \overline{OE} is HIGH the I/O pins are in a high-impedance state.
V _{DD}	Power Supply	N/A	N/A	3.3V core power supply.
V _{DQ}	Power Supply	N/A	N/A	2.5V I/O Supply.
V _{SS}	Ground	N/A	N/A	Ground.
NC	No Connect	N/A	N/A	NC pins are not electrically connected to the device.
ZZ	Sleep Mode	1	HIGH	Asynchronous sleep mode input. ZZ HIGH will gate the CLK internally and power down the IDT71V2577/79 to its lowest power consumption level. Data retention is guaranteed in Sleep Mode.

NOTE:

- All synchronous inputs must meet specified setup and hold times with respect to CLK.

NOTES:

- Stresses greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.
- VDD terminals only.
- VDDQ terminals only.
- Input terminals only.
- I/O terminals only.
- This is a steady-state DC parameter that applies after the power supplies have ramped up. Power supply sequencing is not necessary; however, the voltage on any input or I/O pin cannot exceed VDDQ during power supply ramp up.
- TA is the "instant on" case temperature.

4877 tbl 16

NOTES:

1. Measured as HIGH above V_{IH} and LOW below V_{IL} .
2. Transition is measured $\pm 200mV$ from steady-state.
3. Device must be deselected when powered-up from sleep mode.
4. t_{CFG} is the minimum time required to configure the device based on the \overline{LBO} input. \overline{LBO} is a static input and must not change during normal operation.
5. Commercial temperature range only.

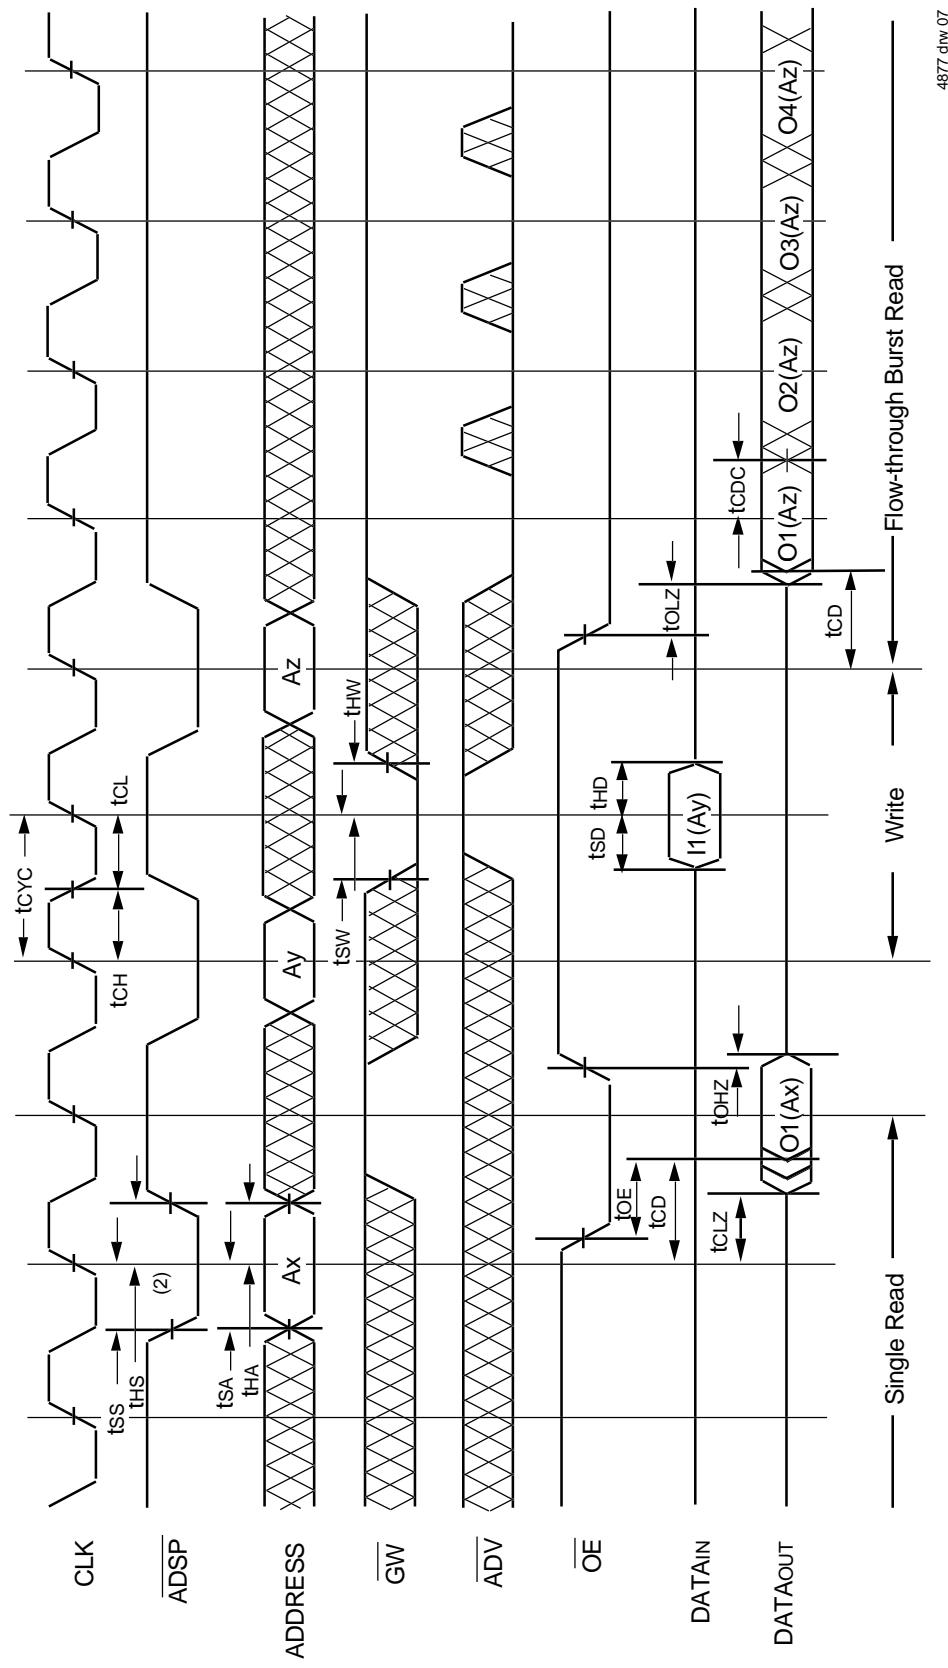

Timing Waveform of Flow-Through Read Cycle^(1,2)

NOTES:

1. O1(Ay) represents the first output from the external address Ax. O2(Ay) represents the next output from the external address Ay. O1(Ay) represents the first output from the external address Ax. O2(Ay) represents the next output from the external address Ay.
2. Z2 input is LOW and LBO is Don't Care for this cycle.
3. CS0 timing transitions are identical but inverted to the CE and CS1 signals. For example, when CE and CS1 are LOW on this waveform, CS0 is HIGH.

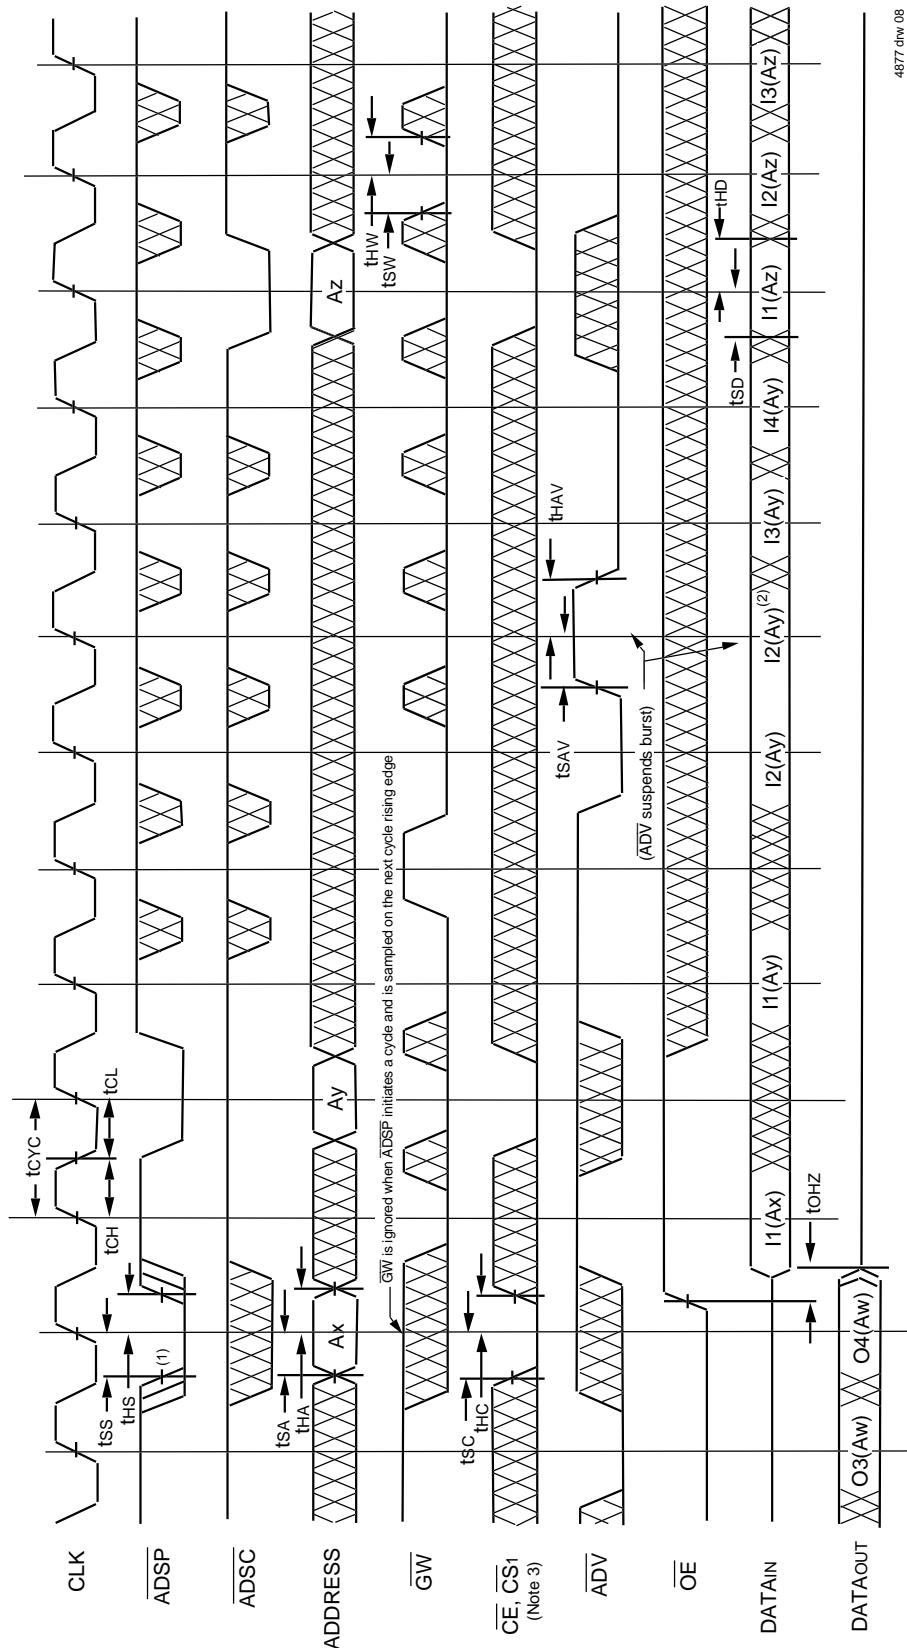

Timing Waveform of Combined Flow-Through Read and Write Cycles^(1,2,3)

NOTES:

1. Device is selected through entire cycle; \overline{CE} and \overline{CS}_1 are LOW, CS_0 is HIGH.
2. Z_2 input is LOW and LBO is Don't Care for this cycle.
3. $O_1(A_y)$ represents the first output from the external address A_y ; $O_1(A_z)$ represents the first output from the external address A_z ; etc. where A_0 and A_1 are advancing for the four word burst in the sequence defined by the state of the LBO input.

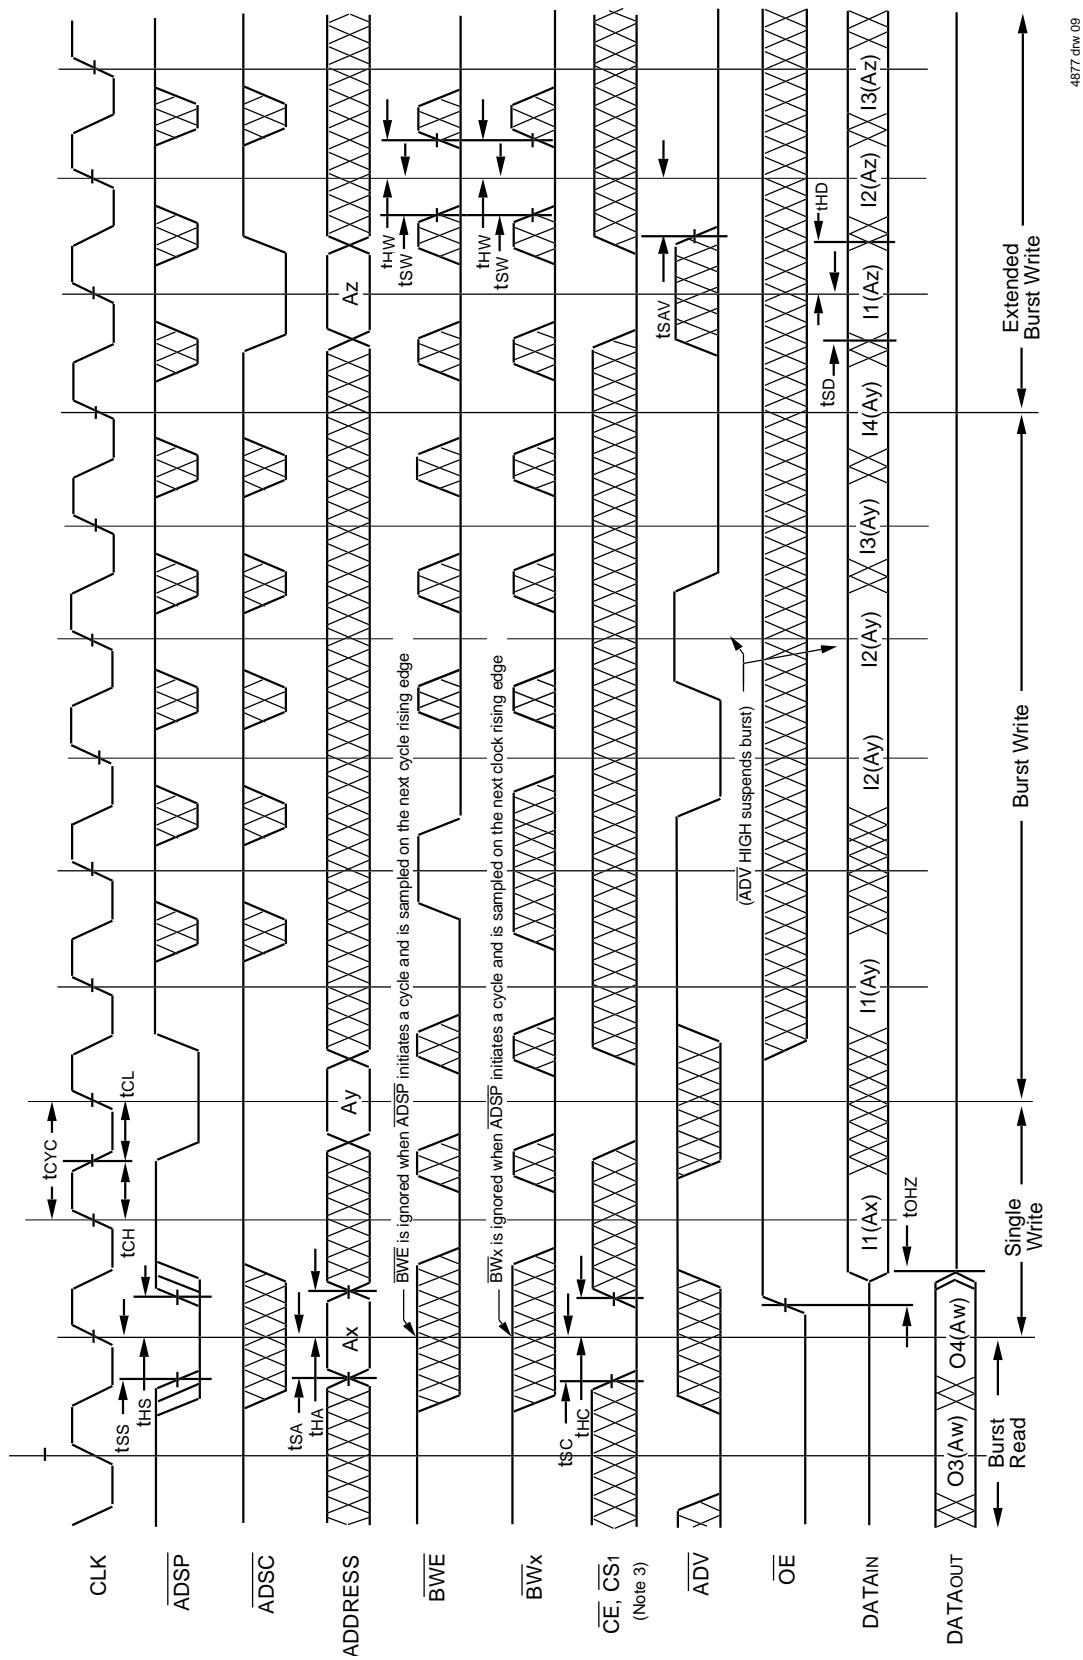

Timing Waveform of Write Cycle No. 1 - $\overline{\text{GW}}$ Controlled^(1,2,3)

NOTES:

1. ZZ input is LOW, $\overline{\text{BWE}}$ is HIGH and $\overline{\text{LBO}}$ is Don't Care for this cycle.
2. O4(Aw) represents the final output data in the burst sequence of the base address Aw. I1(Ay) represents the first input from the external address Ay. I2(Ay) represents the next input data in the burst sequence of the base address Ay, etc. where A0 and A1 are advancing for the four word burst in the sequence defined by the state of the $\overline{\text{LBO}}$ input. In the case of input I2(Ay) this data is valid for two cycles because $\overline{\text{ADV}}$ is high and has suspended the burst.
3. CS0 timing transitions are identical but inverted to the $\overline{\text{CE}}$ and $\overline{\text{CS1}}$ signals. For example, when $\overline{\text{CE}}$ and $\overline{\text{CS1}}$ are LOW on this waveform, CS0 is HIGH.

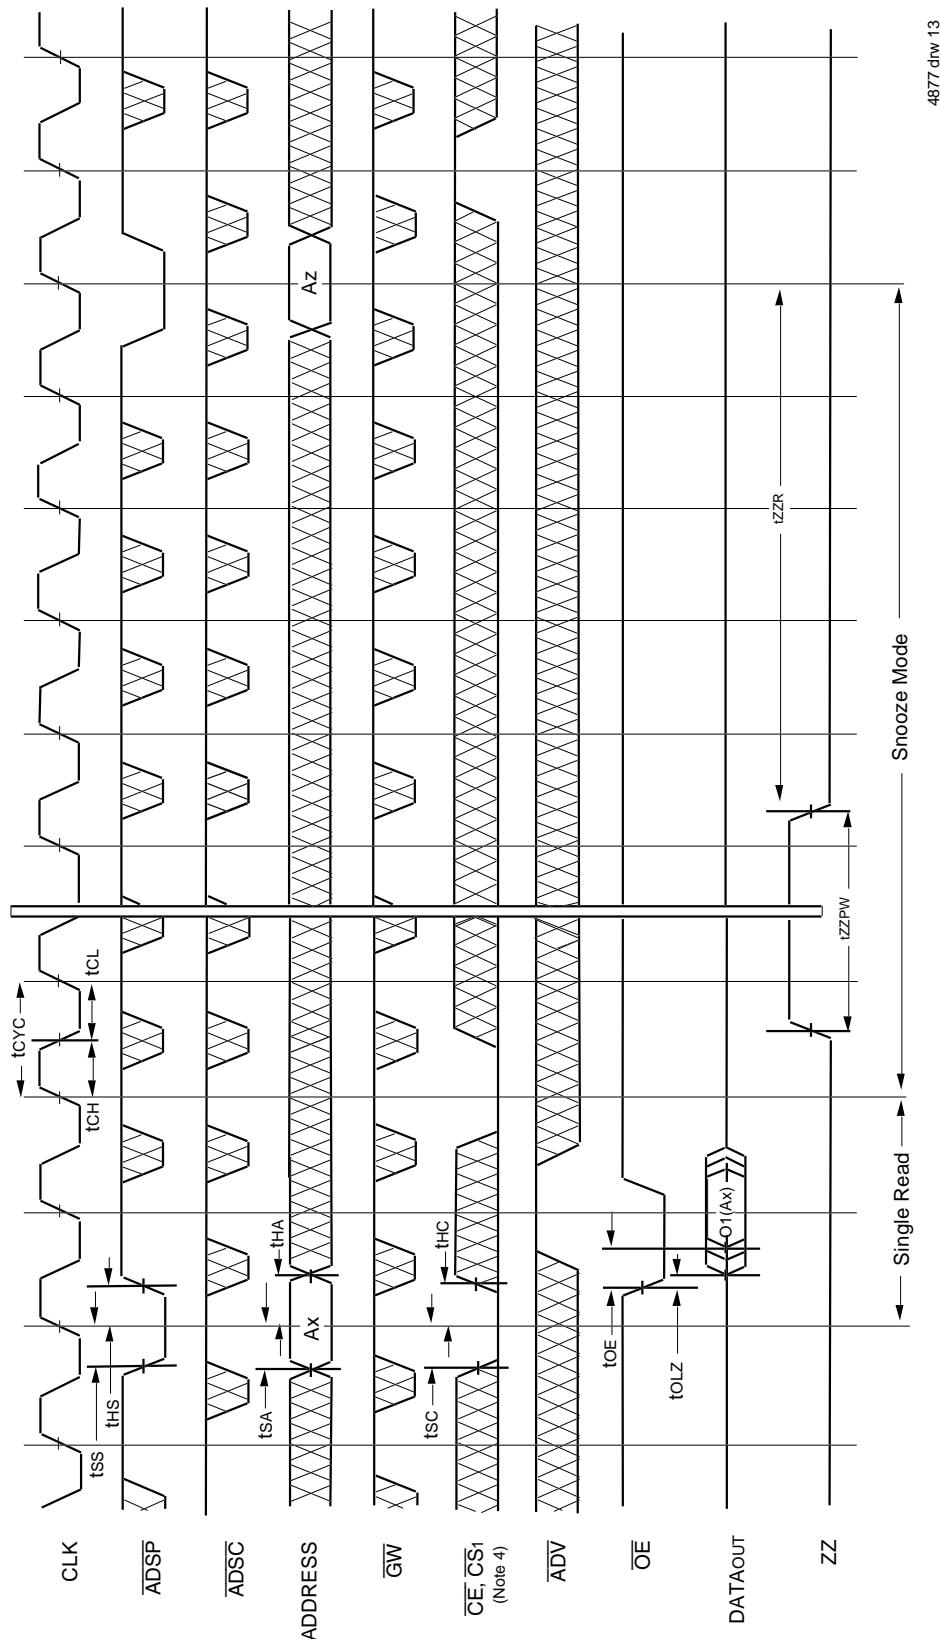

Timing Waveform of Write Cycle No. 2 - Byte Controlled^(1,2,3)

NOTES:

1. ZZ input is LOW, GW is HIGH and LBO is Don't Care for this cycle.
2. O4(Aw) represents the final output data in the burst sequence of the base address Aw. I1(Ax) represents the first input from the external address Ax. I1(Ay) represents the first input from the external address Ay, etc. where A0 and A1 are advancing for the four word burst in the sequence defined by the state of the LBO input. In the case of input I2(Ay) this data is valid for two cycles because ADV is high and has suspended the burst.
3. CS0 timing transitions are identical but inverted to the CE and CS1 signals. For example, when CE and CS1 are LOW on this waveform, CS0 is HIGH.

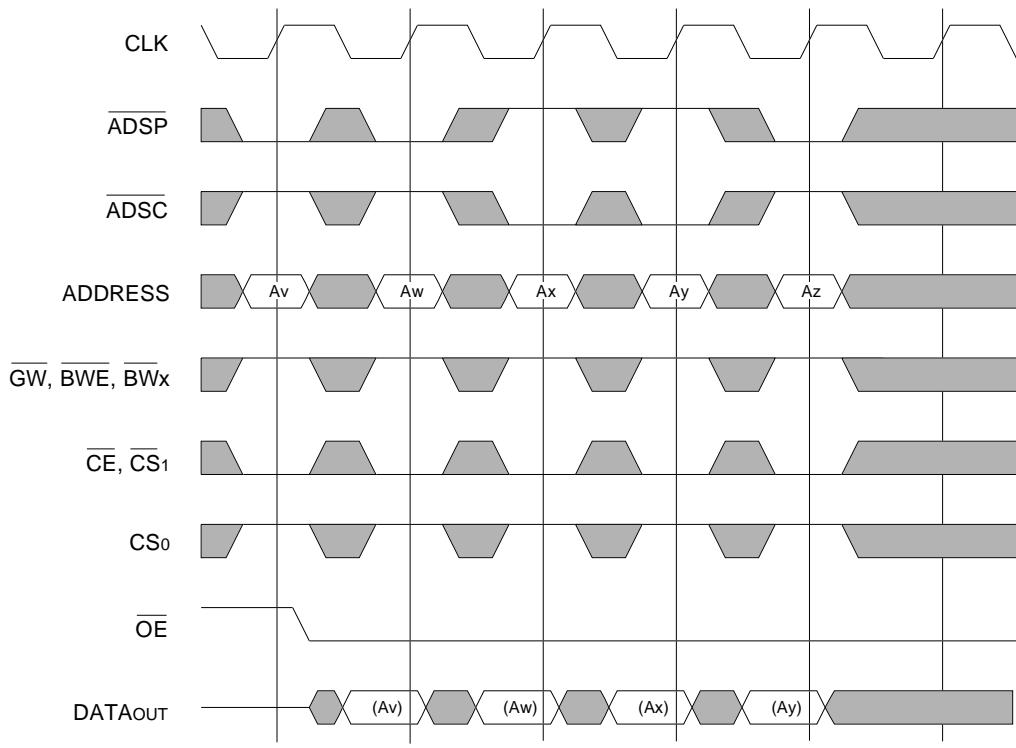

Timing Waveform of Sleep (ZZ) and Power-Down Modes^(1,2,3)

NOTES:

1. Device must power up in deselected mode.
2. $\overline{LB\bar{O}}$ is Don't Care for this cycle.
3. It is not necessary to retain the state of the input registers throughout the Power-down cycle.
4. CS timing transitions are identical but inverted to the \overline{OE} and $\overline{CS1}$ signals. For example, when \overline{OE} and $\overline{CS1}$ are LOW on this waveform, $CS0$ is HIGH.

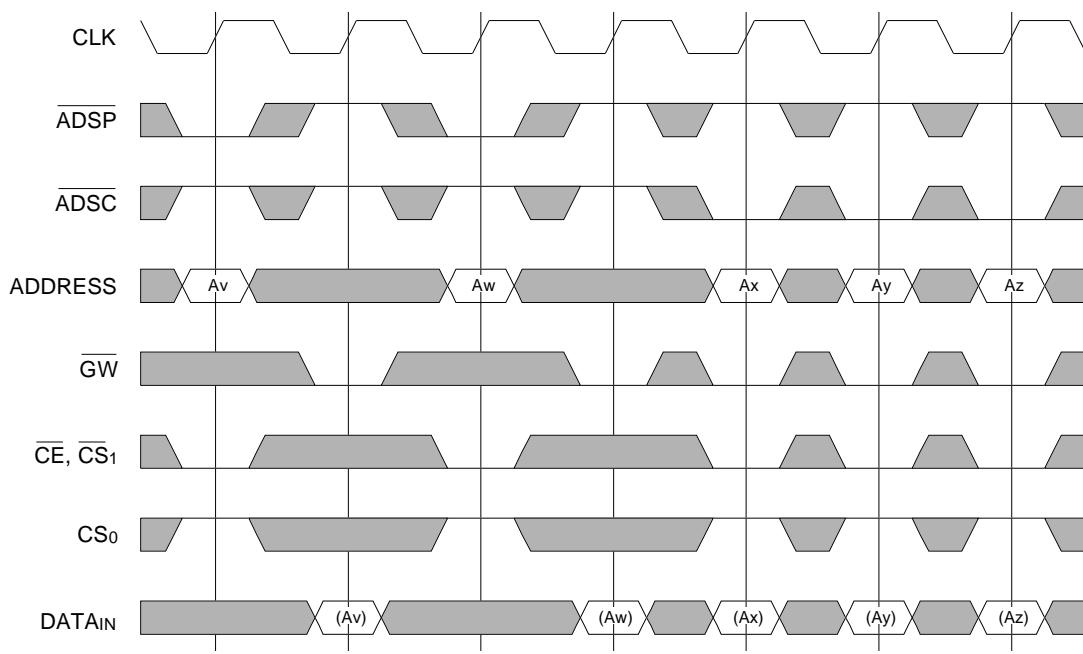

Non-Burst Read Cycle Timing Waveform

NOTES:

1. ZZ input is LOW, \overline{AD} is HIGH and \overline{LBO} is Don't Care for this cycle.
2. (Ax) represents the data for address Ax, etc.
3. For read cycles, \overline{ADSP} and \overline{ADSC} function identically and are therefore interchangeable.

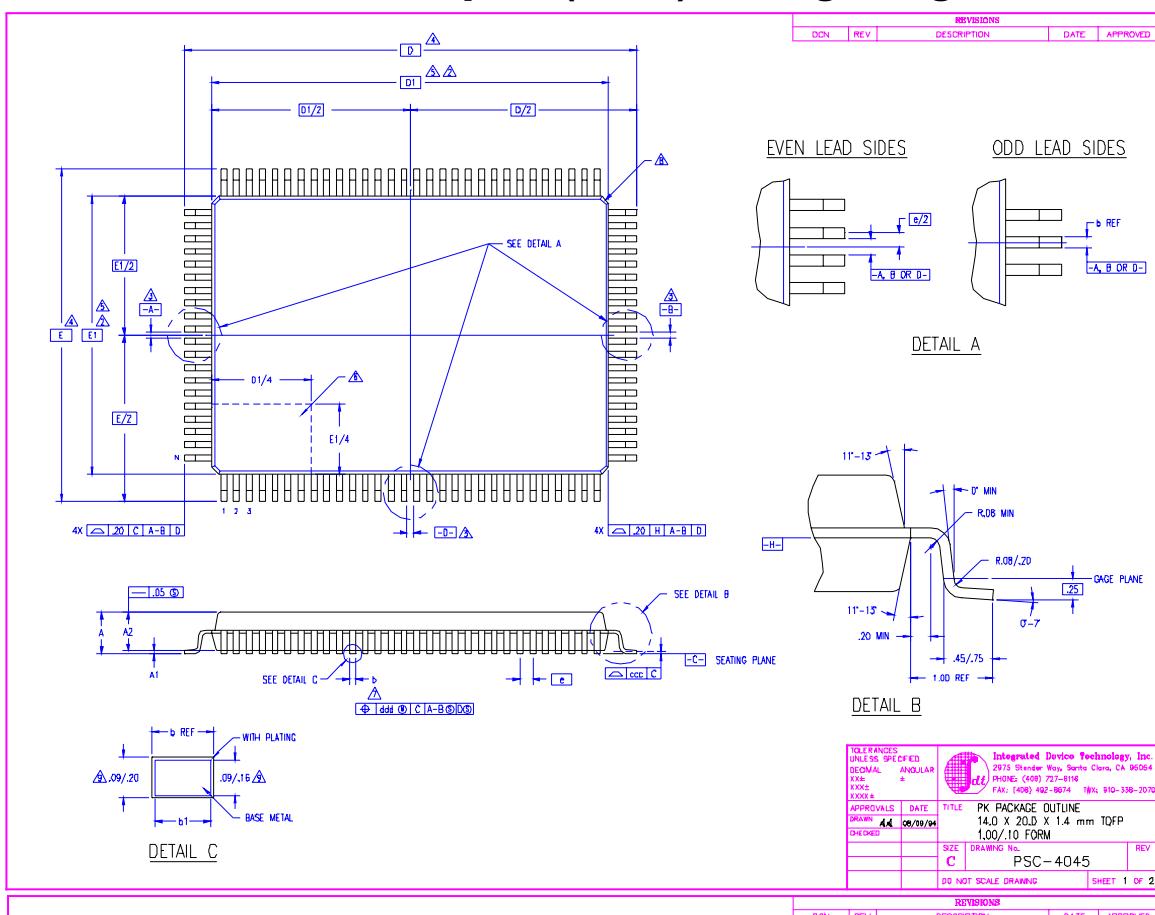

Non-Burst Write Cycle Timing Waveform

NOTES:

1. ZZ input is LOW, \overline{AD} and \overline{OE} are HIGH, and \overline{LBO} is Don't Care for this cycle.
2. (Ax) represents the data for address Ax, etc.
3. Although only \overline{GW} writes are shown, the functionality of \overline{BWE} and \overline{BWx} together is the same as \overline{GW} .
4. For write cycles, \overline{ADSP} and \overline{ADSC} have different limitations.
