MAX3691

## General Description

The MAX3691 serializer is ideal for converting 4-bit-wide, 155Mbps parallel data to 622Mbps serial data in ATM and SDH/SONET applications. Operating from a single +3.3V supply, this device accepts low-voltage differential-signal (LVDS) clock and data inputs for interfacing with high-speed digital circuitry, and delivers a 3.3V PECL serial-data output. A fully integrated PLL synthesizes an internal 622Mbps serial clock from a 155.52MHz reference clock.

The MAX3691 is available in the extended-industrial temperature range (-40°C to +85°C), in a 32-pin TQFP package.

## Applications

- 622Mbps SDH/SONET Transmission Systems
- 622Mbps ATM/SONET Access Nodes
- Add/Drop Multiplexers
- Digital Cross Connects

## Features

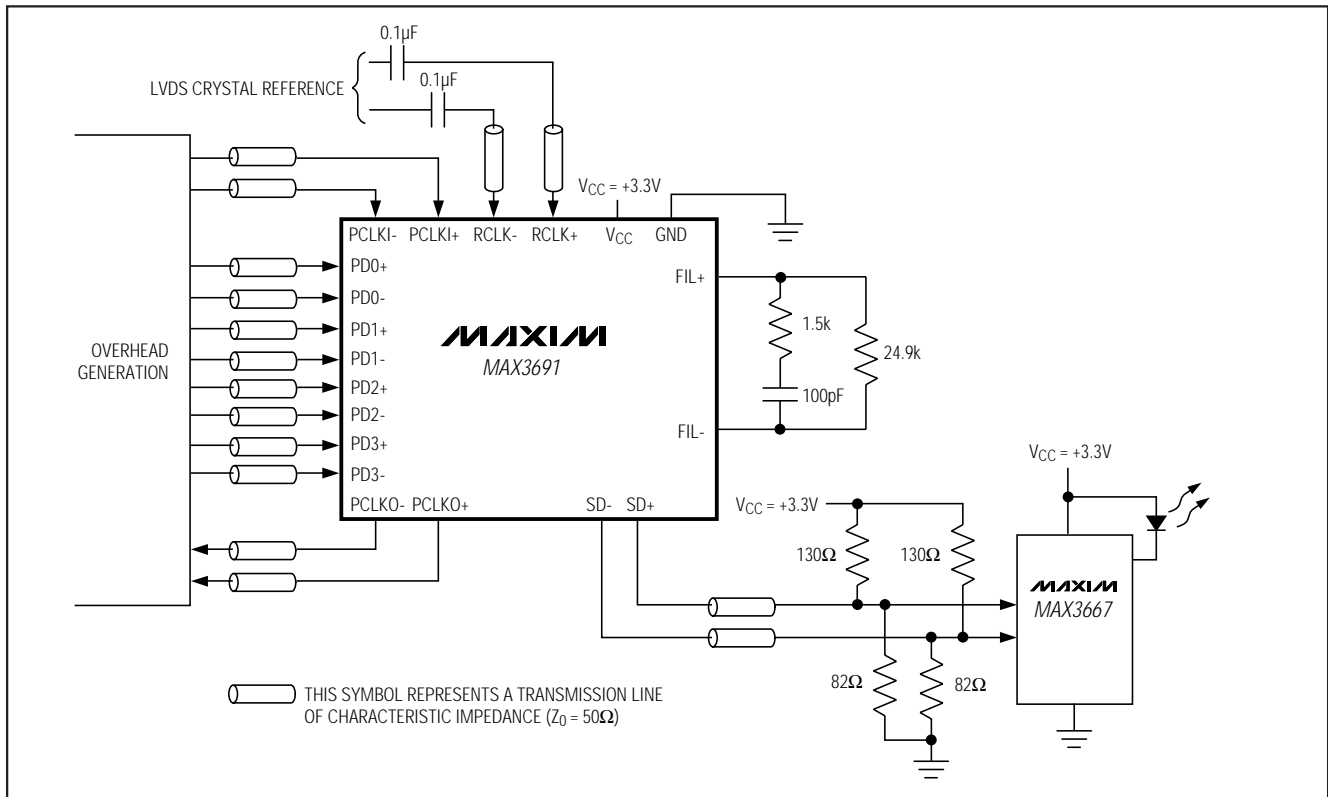

- ◆ **Single +3.3V Supply**
- ◆ **155Mbps Parallel to 622Mbps Serial Conversion**
- ◆ **215mW Power**
- ◆ **LVDS Parallel Clock and Data Inputs**
- ◆ **Differential 3.3V PECL Serial-Data Output**

MAX3691

## Detailed Description

The MAX3691 serializer comprises a 4-bit parallel input register, a 4-bit shift register, control and timing logic, a PECL output buffer, LVDS input/output buffers, and a frequency-synthesizing PLL (consisting of a phase/frequency detector, loop filter/amplifier, and voltage-controlled oscillator). This device converts 4-bit-wide, 155Mbps data to 622Mbps serial data (Figure 1).

The PLL synthesizes an internal 622Mbps reference used to clock the output shift register. This clock is generated by locking onto the external 155.52MHz reference-clock signal (RCLK).

The incoming parallel data is clocked into the MAX3691 on the rising transition of the parallel-clock-input signal (PCLKI). The control and timing logic ensure proper operation if the parallel-input register is latched within a window of time that is defined with respect to the parallel-clock-output signal (PCLKO). PCLKO is the synthesized 622Mbps internal serial-clock signal divided by four. The allowable PCLKO-to-PCLKI skew is -0.7ns to +3.3ns. This defines a timing window at about the PCLKO rising edge, during which a PCLKI rising edge may occur. Figure 2 is the timing diagram.

### Low-Voltage Differential-Signal (LVDS) Inputs and Outputs

The MAX3691 features LVDS inputs and outputs for interfacing with high-speed digital circuitry. The LVDS standard is based on the IEEE 1596.3 LVDS specification. This technology uses 250mV–400mV differential low-voltage swings to achieve fast transition times, minimized power dissipation, and noise immunity.

For proper operation, the parallel-clock LVDS outputs (PCLKO+, PCLKO-) require 100Ω differential DC termination

between the inverting and noninverting outputs. Do not terminate these outputs to ground.

The parallel data and parallel clock LVDS inputs (PD+, PD-, PCLKI+, PCLKI-) are internally terminated with 100Ω differential input resistance, and therefore do not require external termination.

### PECL Outputs

The serial-data PECL outputs (SD+, SD-) require 50Ω DC termination to ( $V_{CC} - 2V$ ). See the *Alternative PECL-Output Termination* section.

## Applications Information

### Alternative PECL-Output Termination

Figure 3 shows alternative PECL output-termination methods. Use Thevenin-equivalent termination when a ( $V_{CC} - 2V$ ) termination voltage is not available. If AC coupling is necessary, be sure that the coupling capacitor is placed following the  $50\Omega$  or Thevenin-equivalent DC termination.

### Layout Techniques

For best performance, use good high-frequency layout techniques. Filter voltage supplies and keep ground connections short. Use multiple vias where possible. Also, use controlled-impedance transmission lines to interface with the MAX3691 clock and data inputs and outputs.
