

LMX2604

Triple-band VCO for GSM900/DCS1800/PCS1900

General Description

The LMX2604 is a fully integrated VCO (Voltage-Controlled Oscillator) IC designed for GSM900/DCS1800/PCS1900 triple-band application. The IC is ideal for use in the transmitter modulation loop by providing extremely small form factor and low phase noise. The IC has two VCOs, one for GSM and a second for DCS/PCS. The IC has two separate buffer amplifiers to drive an external high power amplifier, one for GSM900 band and the other one for DCS1800/PCS1900 bands. The IC also has a differential buffer amplifier to drive a mixer for the offset PLL.

The resonant circuits of the VCOs are fully integrated in the chip to ease the application of the IC. The high quality factor of the embedded tank circuit achieves very low phase noise characteristics at the VCO output. The only required external components are a couple of supply bypass capacitors and matching components.

A control pin for controlling the oscillation frequency is shared by the two VCOs.

The LMX2604 IC is provided in a 20-pin 4x4 LLP (Leadless Leadframe package).

Features

- On-chip Triple-band RF VCOs
 - GSM: 880 MHz to 915 MHz
 - DCS: 1710 MHz to 1785 MHz
 - PCS: 1850 MHz to 1910 MHz
- On-chip tank circuit
- Low phase noise
 - -167 dBc/Hz @ 20 MHz offset in GSM band
 - -163 dBc/Hz @ 20 MHz offset in DCS band
 - -162 dBc/Hz @ 20 MHz offset in PCS band
- High output power
 - +6 dBm in GSM mode
 - +6 dBm in DCS and PCS mode
- Low current consumption
 - 18 mA in GSM mode
 - 15 mA in DCS and PCS mode
- +2.6 V to +3.0 V supply voltage
- 0.25 μ m RF CMOS process
- Small 20-pin 4x4 LLP package

Applications

- Transmit VCO for GSM, DCS, and PCS
- Closed loop modulation systems

Pin Descriptions

Pin Number	Name	I/O	Description
1	CE	I	Chip enable input pin. High=enable, Low=disable
2,4,15	GND (Note 1)	—	Ground pins
3	MIXout	O	Mixer output pin (RF output)
5	BSW	I	Band switch input pin. High=DCS/PCS, Low=GSM
11,19	VDD	—	Supply voltage pins
12	GSMout	O	RF output pin for VCO in GSM band
13	DCSPCSout	O	RF output pin for VCO in DCS and PCS band
16	CPin	I	Charge pump input pin
6,7,8,9,10,14,17,18,20	NC	—	No Connection, These pins must be left open

Note 1: The exposed die attach pad is grounded.

Ordering Information

Package	Part Number	Package Marking	Media Transport	NSC Drawing
20-Pin LLP	LMX2604LQ	LMX2604LQ	1000 Unit Tape and Reel	LQA20A
20-Pin LLP	LMX2604LQX	LMX2604LQ	4500 Unit Tape and Reel	LQA20A

Absolute Maximum Ratings (Notes 3, 4, 5)

Parameter	Symbol	Ratings	Unit
Supply Voltage	V_{DD}	-0.3 to 3.6	V
Input Voltage	V_{IN}	-0.3 to $V_{DD}+0.3$	V
Input Current (Note 2)	I_{IN}	10	mA
Storage Temperature Range	T_{STG}	-65 to 150	°C

Note 2: Maximum input current is for a logic pin, not the power pins.

Recommended Operating Conditions

Parameter	Symbol	Condition	Min	Typical	Max	Unit
Ambient Temperature	T_A	$V_{DD}=3V$	-30	25	85	°C
Supply Voltage (to GND)	V_{DD}		2.6	2.8	3.0	V

Note 3: "Absolute Maximum Ratings" indicate limits beyond which damage to the device may occur. Operating Ratings indicate conditions for which the device is intended to be functional, but do not guarantee specific performance limits. For guaranteed specifications and test conditions, see the Electrical Characteristics. The guaranteed specifications apply only for the test conditions listed.

Note 4: This Device is a high performance RF integrated circuit with an ESD rating < 2 kV and is ESD sensitive. Handling and assembly of this device should only be done at ESD-free workstations.

Note 5: Stresses in excess of the absolute maximum ratings can cause permanent or latent damage to the device. These are absolute stress ratings only. Functional operation of the device is only implied at these or any other conditions in excess of those given in the operation sections of the data sheet. Exposure to absolute maximum ratings for extended periods can adversely affect device reliability

Electrical Characteristics

AC Characteristics ($V_{DD}=2.8V$, $T_A=25^\circ C$; unless otherwise noted)

Symbol	Parameter	Remarks	Min	Typ	Max	Units
f	Frequency Range	GSM Band	880		915	MHz
		DCS Band	1710		1785	MHz
		PCS Band	1850		1910	
K_{VCO}	Tuning Sensitivity (Note 6)	GSM Band	10	15	20	MHz/V
		DCS Band	15	20	25	
		PCS Band	20	25	30	
Pout	Output Power	GSM Band	4	6	8	dBm
		DCS & PCS Band	4	6	8	
PMIXout	Output power of MIXout pin	GSM Band	-5.5	-3.5	-1.5	dBm
		DCS & PCS Band	-4.5	-2.5	-0.5	
L(f)	Phase Noise (GSM Band)	at 100 kHz offset		-120		dBc/Hz
		at 400 kHz offset		-136	-128	
		at 3 MHz offset (Note 7)		-152		
		at 20 MHz offset (Note 7)		-167		
L(f)	Phase Noise (DCS Band)	at 100 kHz offset		-112		dBc/Hz
		at 400 kHz offset		-130	-124	
		at 3 MHz offset (Note 7)		-146		
		at 20 MHz offset (Note 7)		-163		
L(f)	Phase Noise (PCS Band)	at 100 kHz offset		-110		dBc/Hz
		at 400 kHz offset		-129	-124	
		at 3 MHz offset (Note 7)		-145		
		at 20 MHz offset (Note 7)		-162		
	Second Harmonic Suppression	All Bands at RF output port.		-20	-15	dBc

Note 6: Tuning Sensitivity is measured after coarse lock. Minimum and maximum limits are supported by characterization.

Note 7: Supported by characterization

Functional Description

PRODUCT DESCRIPTION

The LMX2604 IC has two VCOs, which are configured as an LC resonant oscillator. The active components and tank elements are all integrated on the IC. The oscillator core and the tank circuit are designed to be immune to external noise such as supply and load variation. The IC is easy-to-use and occupies extremely small area in the board.

Two output amplifiers are also integrated to deliver high output power of +6 dBm in GSM/DCS/PCS applications. The amplifiers isolate the oscillator cores from the external load, and drive the external 50 ohm load. The output driver is designed to have low noise floor and to reduce pulling by load variation. An additional amplifier to drive the mixer in the transmit PLL is also provided. Only an attenuator composed of a few passive elements is necessary to meet the power level of the mixer input of the transmit PLL.

The frequency of the oscillator is controlled by the CPin pin, which is internally connected to the varactor. This control pin is connected to the loop filter of the modulation loop in the transmit path. Any additional noise on this tuning input is directly translated into FM noise, which can degrade the phase noise characteristics of the oscillator. Typically, the loop filter of the PLL provides an appropriately low impedance source at its output and thus proper additional filtering stage is often required to reduce the high frequency noise and spurious signals.

FREQUENCY SELECTION AND POWER DOWN CONTROL

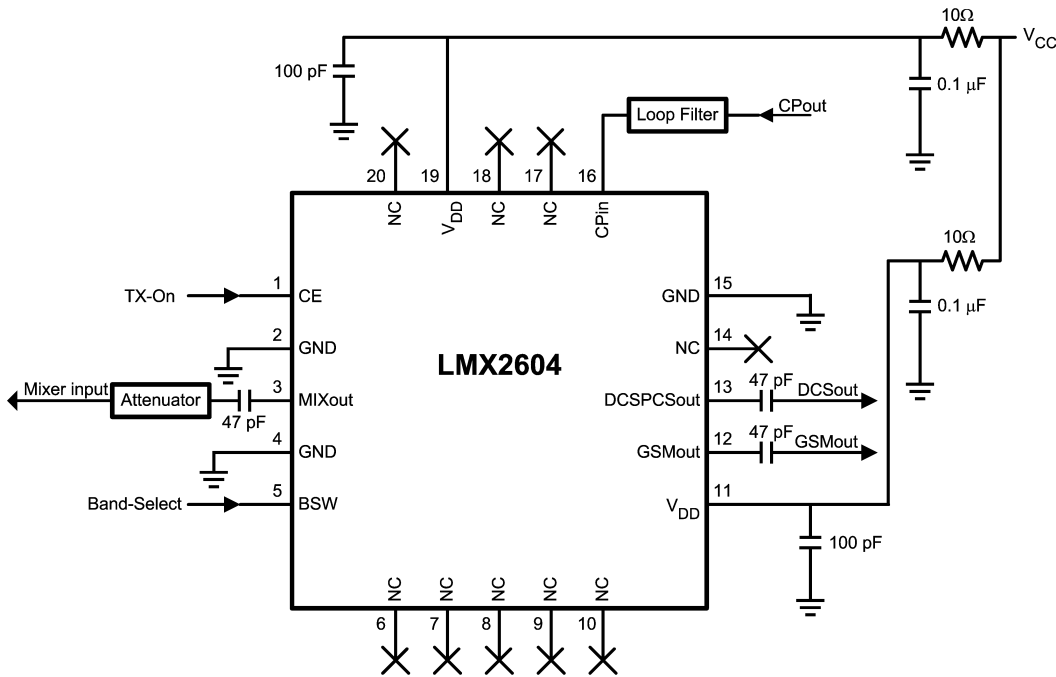

The BSW pin selects the operating frequency band. The table below shows the appropriate settings with the CE pin.

CE	BSW	Output
Low	Low	X
Low	High	X
High	Low	Low Band (GSM)
High	High	High Band (DCS/PCS)

In real implementation, the component values of the tank circuit vary from the nominal value. The IC has built-in circuit to track the variation and compensate that kind of the variation during normal operation. This self-correction algorithm does not require any external control signal and elements. The figure below shows an application circuit of the LMX2604. The LMX2604 is developed for the use in a GSM handset as part of the transmitter PLL. To complete the offset PLL in the transmit path, several passive elements for the external loop filter should be also provided. The charge pump output port of the external transceiver IC is fed to the CPin pin.

The locking process of the LMX2604 is composed of two stages. First, the internal control circuitry of the LMX2604 controls the fast frequency acquisition behavior of the LMX2604. After the frequency acquisition, the whole loop enters in its normal operating mode.

Application Circuit of LMX2604

Functional Description (Continued)

FREQUENCY ACQUISITION

On the rising edge of CE the VCO goes through a frequency acquisition mode which coarse locks the PLL to the approximate final frequency. This portion of the lock digitally sets the

frequency such that the final tuning voltage on the CPin line of the VCO is approximately $V_{dd}/2$. Benefits of this system is the maximum required charge pump voltage is reduced as large frequency ranges may be tuned with a small tuning voltage. This makes the digitally tuned VCO different from conventional analog VCOs.

Notes

LIFE SUPPORT POLICY

NATIONAL'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF THE PRESIDENT AND GENERAL COUNSEL OF NATIONAL SEMICONDUCTOR CORPORATION. As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, and whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury to the user.
2. A critical component is any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.

BANNED SUBSTANCE COMPLIANCE

National Semiconductor certifies that the products and packing materials meet the provisions of the Customer Products Stewardship Specification (CSP-9-111C2) and the Banned Substances and Materials of Interest Specification (CSP-9-111S2) and contain no "Banned Substances" as defined in CSP-9-111S2.
