

DS36C200

Dual High Speed Bi-Directional Differential Transceiver

General Description

The DS36C200 is a dual transceiver device optimized for high data rate and low power applications. This device provides a single chip solution for a dual high speed bi-directional interface. Also, both control pins may be routed together for single bit control of datastreams. Both control pins are adjacent to each other for ease of routing them together. The DS36C200 is compatible with IEEE 1394 physical layer and may be used as an economical solution with some considerations. Please reference the application information on 1394 for more information. The device is in a 14-lead small outline package. The differential driver outputs provides low EMI with its low output swings typically 210 mV. The receiver offers ± 100 mV threshold sensitivity, in addition to common-mode noise protection.

Features

- Optimized for DSS to DVHS interface link
- Compatible IEEE 1394 signaling voltage levels
- Operates above 100 Mbps
- Bi-directional transceivers
- 14-lead SOIC package
- Ultra low power dissipation
- ± 100 mV receiver sensitivity
- Low differential output swing typical 210 mV
- High impedance during power off

V_{TL}	Input Threshold Low			–100			mV
I_{IN}	Input Current	$V_{IN} = +2.4V$ or 0V		–10	± 1	+10	μA
V_{OH}	Output High Voltage	$I_{OH} = -400 \mu A$	RO	3.8	4.9		V
		Inputs Open		3.8	4.9		V
		Inputs Terminated, $R_t = 55\Omega$		3.8	4.9		V
		Inputs Shorted, $V_{ID} = 0V$			4.9		V
V_{OL}	Output Low Voltage	$I_{OL} = 2.0$ mA, $V_{ID} = -200$ mV			0.1	0.4	V
I_{OSR}	Output Short Circuit Current	$V_{OUT} = 0V$		–15	–60	–100	mA
DEVICE CHARACTERISTICS							
V_{IH}	Input High Voltage		DI, DE RE*	2.0		V_{CC}	V
V_{IL}	Input Low Voltage			GND		0.8	V
I_{IH}	Input High Current	$V_{IN} = V_{CC}$ or 2.4V			± 1	± 10	μA
I_{IL}	Input Low Current	$V_{IN} = GND$ or 0.4V			± 1	± 10	μA
V_{CL}	Input Clamp Voltage	$I_{CL} = -18$ mA		–1.5	–0.8		V
I_{CCD}	Power Supply Current	No Load, DE = RE* = V_{CC}	V_{CC}		3	7	mA
		$R_L = 55\Omega$, DE = RE* = V_{CC}			11	17	mA
I_{CCR}		DE = RE* = 0V			6	10	mA

Note 1: "Absolute Maximum Ratings" are those values beyond which the safety of the device cannot be guaranteed. They are not meant to imply that the devices should be operated at these limits. The table of "Electrical Characteristics" specifies conditions of device operation.

Note 2: Current into device pins is defined as positive. Current out of device pins is defined as negative. All voltages are referenced to ground except V_{OD} and V_{ID} .

Note 3: All typicals are given for $V_{CC} = +5.0V$ and $T_A = +25^\circ C$.

Note 4: ESD Rating: HBM (1.5 k Ω , 100 pF) ≥ 3.5 kV

EIAJ (0 Ω , 200 pF) $\geq 300V$

Note 5: C_L includes probe and fixture capacitance.

Electrical Characteristics (Notes 2, 3, 7) (Continued)

Note 6: Generator waveform for all tests unless otherwise specified: $f = 1 \text{ MHz}$, $Z_O = 50 \Omega$, $t_r \leq 1 \text{ ns}$, $t_f \leq 1 \text{ ns}$ (0%–100%).

Note 7: The DS36C200 is a current mode device and only function with datasheet specification when a resistive load is applied to the drivers outputs.

Switching Characteristic

Application Information

TRUTH TABLES

The DS36C200 has two enable pins DE and RE*, however, the driver and receiver should never be enabled simultaneously. Enabling both could cause multiple channel contention between the receiver output and the driving logic. It is recommended to route the enables together on the PC board. This will allow a single bit [DE/RE*] to control the chip. This DE/RE* bit toggles the DS36C200 between Receive mode and Transmit mode. When the bit is asserted HIGH the device is in Transmit mode. When the bit is asserted LOW the device is in Receive mode. The mode determines the function of the I/O pins: DI/RO, DO/RI+, and DO/RI-. Please note that some of the pins have been identified by its function in the corresponding mode in the three tables below. For example, in Transmit mode the DO/RI+ pin is identified as DO+. This was done for clarity in the tables only and should not be confused with the pin identification throughout the rest of this document. Also note that a logic low on the DE/RE* bit corresponds to a logic low on both the DE pin and the RE* pin. Similarly, a logic high on the DE/RE* bit corresponds to a logic high on both the DE pin and the RE* pin.

Application Information (Continued)

Receive Mode

Input(s)		Input/Output	
DE	RE*	[RI+] – [RI–]	RO
L	L	> +100 mV	H
L	L	< –100 mV	L
L	L	100 mV > & > –100 mV	X
L	H	X	Z

Transmit Mode

Input(s)		Input/Output		
DE	RE*	DI	DO+	DO–
H	H	L	L	H
H	H	H	H	L
H	H	2 > & > 0.8	X	X
L	H	X	Z	Z

H = Logic high level
L = Logic low level
X = Indeterminant state
Z = High impedance state

TABLE 1. Device Pin Descriptions

Pin#	Name (In mode only)	Mode	Description
3	DE	Transmit	Driver Enable: When asserted low driver is disabled. And when asserted high driver is enabled.
1, 7	DI		TTL/CMOS driver input pins
10, 13	DO+		Non-inverting driver output pin
11, 12	DO–		Inverting driver output pin
4	RE*	Receive	Receiver Enable: When asserted low receiver is enabled. And when asserted high receiver is disabled.
1, 7	RO		Receiver output pin
10, 13	RI+		Positive receiver input pin
11, 12	RI–		Negative receiver input pin
5	GND	Transmit and	Ground pin
2	V _{CC}	Receive	Positive power supply pin, +5V ± 10%
6, 8, 9, 14	NC		No Connect

IEEE 1394

The DS36C200 drives and receives IEEE 1394 physical layer signal levels. The current mode driver is capable of driving a 55Ω load with V_{OD} between 172 mV and 285 mV. The DS36C200 is not designed to work with a link layer controller IC requiring full 1394 physical layer compliance to the standard. No clock generator, no arbitration, and no encode/decode logic is provided with this device. For a 1394 link where speed sensing, bus arbitration, and other functions are not required, a controller and the DS36C200 will provide a cost effective, high speed dedicated link. This is shown in *Figure 10*. In applications that require fully compliant 1394 protocol, a link layer controller and physical layer controller will be required as shown in *Figure 10*. The physical layer controller supports up to three DS36C200 devices (not shown).

The DS36C200 drivers are current mode drivers and intended to work with a two 110Ω termination resistors in parallel with each other. The termination resistors should match the characteristic impedance of the transmission media. The drivers are current mode devices therefore the resistors are required. Both resistors are required for half duplex operation and should be placed as close to the DO/RI+ and DO/RI– pins as possible at opposite ends of the bus. However, if your application only requires simplex operation, only one termination resistor is required. In addition, note the voltage levels will vary from those in the datasheet due to different loading. Also, AC or unterminated configurations are not used with this device. Multiple node configurations are pos-

sible as long as transmission line effects are taken into account. Discontinuities are caused by mid-bus stubs, connectors, and devices that affect signal integrity.

The differential line driver is a balanced current source design. A current mode driver, generally speaking has a high output impedance and supplies a constant current for a range of loads (a voltage mode driver on the other hand supplies a constant voltage for a range of loads). Current is switched through the load in one direction to produce a logic state and in the other direction to produce the other logic state. The typical output current is mere 3.8 mA, a minimum of 3.1 mA, and a maximum of 5.2 mA. The current mode **requires** that a resistive termination be employed to terminate the signal and to complete the loop as shown in *Figure 11*. The 3.8 mA loop current will develop a differential voltage of 210 mV across the 55Ω termination resistor which the receiver detects with a 110 mV minimum differential noise margin neglecting resistive line losses (driven signal minus receiver threshold (210 mV – 100 mV = 110 mV)). The signal is centered around +1.2V (Driver Offset, V_{OS}) with respect to ground as shown in *Figure 7*.

The current mode driver provides substantial benefits over voltage mode drivers, such as an RS-422 driver. Its quiescent current remains relatively flat versus switching frequency. Whereas the RS-422 voltage mode driver increases exponentially in most case between 20 MHz–50 MHz. This is due to the overlap current that flows between the rails of the device when the internal gates switch. Whereas the current mode driver switches a fixed current between its output without any substantial overlap current. This is similar to

Application Information (Continued)

some ECL and PECL devices, but without the heavy static I_{CC} requirements of the ECL/PECL designs. LVDS requires > 80% less current than similar PECL devices. AC specifications for the driver are a tenfold improvement over other existing RS-422 drivers.

Fail-safe Feature:

The LVDS receiver is a high gain, high speed device that amplifies a small differential signal (20mV) to CMOS logic levels. Due to the high gain and tight threshold of the receiver, care should be taken to prevent noise from appearing as a valid signal.

The receiver's internal fail-safe circuitry is designed to source/sink a small amount of current, providing fail-safe protection (a stable known state of HIGH output voltage) for floating, terminated or shorted receiver inputs.

1. **Open Input Pins.** The DS36C200 is a dual transceiver device, and if an application requires only one receiver, the unused channel inputs should be left OPEN. Do not tie the receiver inputs to ground or any other voltages. The input is biased by internal high value pull up or pull

down resistors to set the output to a HIGH state. This internal circuitry will guarantee a HIGH, stable output state for open inputs.

2. **Terminated Input.** If the driver is disconnected (cable unplugged), or if the driver is in a TRI-STATE or power-off condition, the receiver output will again be in a HIGH state, even with the end of the cable 100 Ω termination resistor across the input pins. The unplugged cable can become a floating antenna which can pick up noise. If the cable picks up more than 10mV of differential noise, the receiver may see the noise as a valid signal and switch. To insure that any noise is seen as common-mode and not differential, a balanced interconnect should be used. Twisted pair cable will offer better balance than flat ribbon cable.
3. **Shorted Inputs.** If a fault condition occurs that shorts the receiver inputs together, thus resulting in a 0V differential input voltage, the receiver output will remain in a HIGH state. Shorted input fail-safe is not supported across the common-mode range of the device (GND to 2.4V). It is only supported with inputs shorted and no external common-mode voltage applied.

LIFE SUPPORT POLICY

NATIONAL'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF THE PRESIDENT OF NATIONAL SEMICONDUCTOR CORPORATION. As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, and whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury to the user.
2. A critical component in any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.
