Quadruple 2-input NAND gate

HEF4011UB gates

DESCRIPTION

The HEF4011UB is a quadruple 2-input NAND gate. This unbuffered single stage version provides a direct implementation of the NAND function. The output impedance and output transition time depends on the input voltage and input rise and fall times applied.

- HEF4011UBP(N): 14-lead DIL; plastic (SOT27-1)
- HEF4011UBD(F): 14-lead DIL; ceramic (cerdip) (SOT73)
- HEF4011UBT(D): 14-lead SO; plastic (SOT108-1)
- (): Package Designator North America

FAMILY DATA, I_{DD} LIMITS category GATES

See Family Specifications for V_{IH}/V_{IL} unbuffered stages

Quadruple 2-input NAND gate

APPLICATION INFORMATION

Some examples of applications for the HEF4011UB are shown below.

Because of the fact that this circuit is unbuffered, it is suitable for use in (partly) analogue circuits.

In Fig.9 the oscillation frequency is mainly determined by R1C1, provided $R1 \ll R2$ and $R2C2 \ll R1C1$. The function of R2 is to minimize the influence of the forward voltage across the protection diodes on the frequency; C2 is a stray (parasitic) capacitance. The period T_p is given by $T_p = T_1 + T_2$, in which

$$T_1 = R1C1 \ln \frac{V_{DD} + V_{ST}}{V_{ST}} \text{ and } T_2 = R1C1 \ln \frac{2V_{DD} - V_{ST}}{V_{DD} - V_{ST}} \text{ where}$$

V_{ST} is the signal threshold level of the gate. The period is fairly independent of V_{DD} , V_{ST} and temperature. The duty factor, however, is influenced by V_{ST} .

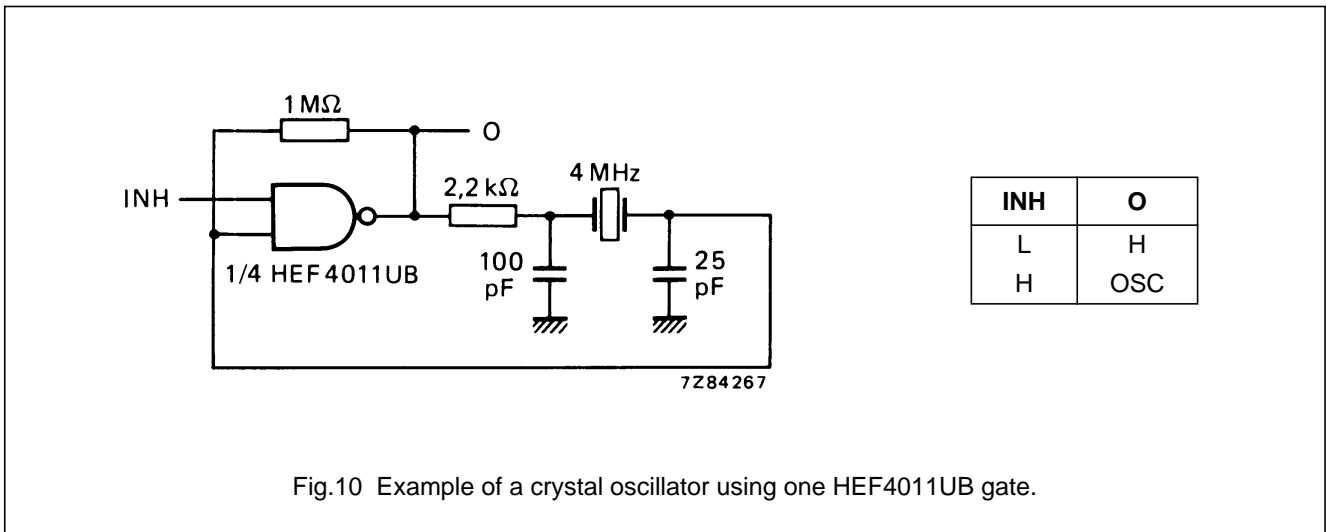

Fig.9 (a) Astable relaxation oscillator using two HEF4011UB gates; the diodes may be BAW62; C2 is a parasitic capacitance.
(b) Waveforms at the points marked A, B, C and D in the circuit diagram.

NOTES

If a gate is just used as an amplifying inverter, there are two possibilities:

- Connecting the inputs together gives simpler wiring, but makes the device output not completely symmetrical.
- Connecting one input to V_{DD} will give the device a symmetrical output.
