Revision 1.2

December 2002

**8M x 16Bit x 4 Banks Mobile SDRAM**

**FEATURES**

- 3.0V power supply
- LVCMOS compatible with multiplexed address
- Four banks operation
- MRS cycle with address key programs
  - CAS latency (1 & 2 & 3)
  - Burst length (1, 2, 4, 8 & Full page)
  - Burst type (Sequential & Interleave)
- All inputs are sampled at the positive going edge of the system clock.
- Burst read single-bit write operation
- DQM for masking
- Auto & self refresh
- 64ms refresh period (8K cycle)
- 1 /CS Support.
- Commercial Temperature Operation (-25°C ~ 70°C).  
Extended Temperature Operation (-25°C ~ 85°C).  
Industrial Temperature Operation (-40°C ~ 85°C).
- 54balls DDP CSP

**GENERAL DESCRIPTION**

The K4S511633C is 536,870,912 bits synchronous high data rate Dynamic RAM organized as 4 x 8,388,608 words by 16bits, fabricated with SAMSUNG's high performance CMOS technology. Synchronous design allows precise cycle control with the use of system clock I/O transactions are possible on every clock cycle. Range of operating frequencies, programmable burst length and programmable latencies allow the same device to be useful for a variety of high bandwidth, high performance memory system applications.

**ORDERING INFORMATION**

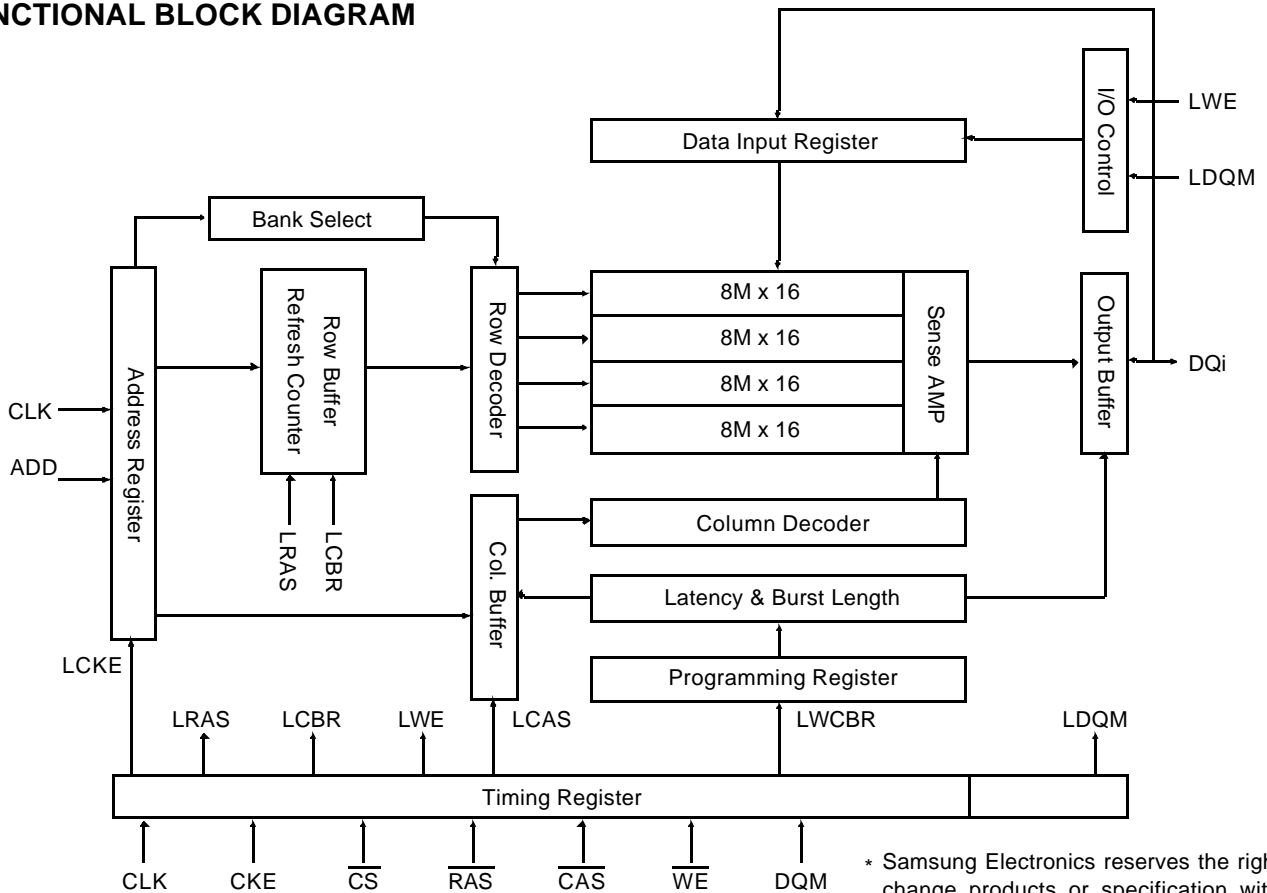

Part No.	Max Freq.	Interface	Package
K4S511633C-YL/N80	125MHz(CL=3) 100MHz(CL=2)	LVCMOS	54 CSP
K4S511633C-YL/N1H	100MHz(CL=2)

- YN : Low Power, Operating Temp : -25°C ~ 85°C.
- YL : Low Power, Operating Temp : -25°C ~ 70°C.
- YP : Low Power, Operating Temp : -40°C ~ 85°C.

**Note :**

1. In case of 33MHz Frequency, CL1 can be supported.

Short circuit current	I <sub>OS</sub>	50	mA

## Notes :

Permanent device damage may occur if ABSOLUTE MAXIMUM RATINGS are exceeded.

Functional operation should be restricted to recommended operating condition.

Exposure to higher than recommended voltage for extended periods of time could affect device reliability.

## DC OPERATING CONDITIONS

	CAS latency=2	1				
	CAS latency=1	-	0			

**Notes :**

1. The minimum number of clock cycles is determined by dividing the minimum time required with clock cycle time and then rounding off to the next higher integer.
2. Minimum delay is required to complete write.
3. Minimum  $t_{RD}=2\text{CLK}$  and  $t_{DAL}(=t_{RD} + t_{RP})$  is required to complete both of last data write command( $t_{RD}$ ) and precharge command( $t_{RP}$ ).  $t_{RD}=1\text{CLK}$  can be supported only in the case under 100MHz with manual precharge mode.
4. All parts allow every cycle column address change.
5. In case of row precharge interrupt, auto precharge and read burst stop.

	CAS latency=1			-		-		20		

**Notes :**

- Parameters depend on programmed CAS latency.
- If clock rising time is longer than 1ns, (tr/2-0.5)ns should be added to the parameter.
- Assumed input rise and fall time (tr & tf) = 1ns.  
If tr & tf is longer than 1ns, transient time compensation should be considered,  
i.e., [(tr + tf)/2-1]ns should be added to the parameter.

**Notes :**

- This is to advise Samsung customers that, in accordance with certain terms of an agreement, Samsung is prohibited from selling any DRAM products configured in "Multi-Die Plastic" format for use as components in general and scientific computers, such as mainframes, servers, work stations or desk top personal computers (hereinafter "Prohibited Computer Use"). Applications such as mobile, including cell phones, telecom, including televisions and display monitors, or non-desktop computer systems, including laptops, notebook computers, are, however, permissible. "Multi-Die Plastic" is defined as two or more DRAM die encapsulated within a single plastic leaded package.
- Samsung are not designed or manufactured for use in a device or system that is used under circumstance in which human life is potentially at stake. Please contact to the memory marketing team in samsung electronics when considering the use of a product contained herein for any specific purpose, such as medical, aerospace, nuclear, military, vehicular or undersea repeater use.

**Notes :**

1. OP Code : Operand Code

A<sub>0</sub> ~ A<sub>12</sub> & BA<sub>0</sub> ~ BA<sub>1</sub> : Program keys. (@MRS)

2. MRS can be issued only at all banks precharge state.

A new command can be issued after 2 CLK cycles of MRS.

3. Auto refresh functions are the same as CBR refresh of DRAM.

The automatical precharge without row precharge command is meant by "Auto".

Auto/self refresh can be issued only at all banks precharge state.

4. BA<sub>0</sub> ~ BA<sub>1</sub> : Bank select addresses.If both BA<sub>0</sub> and BA<sub>1</sub> are "Low" at read, write, row active and precharge, bank A is selected.If BA<sub>0</sub> is "Low" and BA<sub>1</sub> is "High" at read, write, row active and precharge, bank B is selected.If BA<sub>0</sub> is "High" and BA<sub>1</sub> is "Low" at read, write, row active and precharge, bank C is selected.If both BA<sub>0</sub> and BA<sub>1</sub> are "High" at read, write, row active and precharge, bank D is selected.If A<sub>10/AP</sub> is "High" at row precharge, BA<sub>0</sub> and BA<sub>1</sub> are ignored and all banks are selected.

5. During burst read or write with auto precharge, new read/write command can not be issued.

Another bank read/write command can be issued after the end of burst.

New row active of the associated bank can be issued at t<sub>RP</sub> after the end of burst.

6. Burst stop command is valid at every burst length.

7. DQM sampled at the positive going edge of CLK masks the data-in at that same CLK in write operation (Write DQM latency is 0), but in read operation it makes the data-out Hi-Z state after 2 CLK cycles. (Read DQM latency is 2).
