GENERAL DESCRIPTION

The Z86C3X/C40 Consumer Controller Processors (CCP) are members of the Z8® single-chip microcontroller family offering a unique register-to-register architecture that avoids accumulator bottlenecks and offers fast execution of code.

Three address spaces (Program Memory, Register File, and Expanded Register File [ERF]), support a wide range of memory configurations. Through the ERF, the designer has access to three additional control registers that provide extra peripheral devices, I/O ports, and register addresses. The rest of the ERF is not physically implemented and is open for future expansion.

For applications demanding powerful I/O capabilities, the Z86C3X/C40's dedicated input and output lines are grouped into three and four ports, respectively, and are configurable under software control to provide timing, status signals, or parallel I/O.

Two on-chip counter/timers, with a large number of selectable modes, offload the system of administering real-time tasks such as counting/timing and I/O data communications.

With ROM/ROMless selectivity, the Z86C40 provides both external memory and pre-programmed ROM, which enables these Z8 microcontrollers to be used in high-volume applications, or where code flexibility is required.

Notes:

All Signals with a preceding front slash, "/", are active Low, e.g.: B//W (WORD is active Low); /B/W (BYTE is active Low, only).

Notes:

- [1] This applies to all pins except XTAL pins and where otherwise noted.
 [2] There is no input protection diode from pin to V_{DD} .
 [3] This excludes XTAL pins.
 [4] Device pin is not at an output Low state.

Notice:

Stresses greater than those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at any condition above those indicated in the operational sections of these specifications is not implied. Exposure to absolute maximum rating conditions for an extended period may affect device reliability.

Total power dissipation should not exceed 1.21 W for the package. Power dissipation is calculated as follows:

$$\text{Total Power Dissipation} = V_{DD} \times [I_{DD} - (\text{sum of } I_{OH})] \\ + \text{sum of } [(V_{DD} - V_{OH}) \times I_{OH}] \\ + \text{sum of } (V_{OL} \times I_{OL})$$

STANDARD TEST CONDITIONS

The characteristics listed below apply for standard test conditions as noted. All voltages are referenced to Ground. Positive current flows into the referenced pin (Test Load).

Standard Test Load

All timing references use 0.7 V_{CC} for a logic 1 and 0.2 V_{CC} for a logic 0. For Standard Mode (not Low-EMI Mode for outputs) with SMR D1 = 0, D0 = 0.
